IF it is wise to buy and use expensive farm machinery, it is good business to keep it in perfect running order.

No matter what the size, style or type of tractor, harvester, separator, or other machine, it will do more and better work, at less cost, if it is correctly lubricated. And it will last longer.

Imperial Farm Lubricants were developed to meet the peculiar requirements of farm machines. Each is scientifically formulated and standardized for a particular service—an oil or grease that has proved its value under actual working conditions.

For correct automobile and tractor lubrication, follow the Imperial Charts of Recommendations—on display wherever Imperial Lubricants are sold. When in doubt, ask the Imperial Oil Man; or write to us.

Possibilities of Bee Keeping in Nova Scotia

Prof. W. H. Brittain then took up the subject. The Possibilities of Bee Keeping in Nova Scotia, and gave valuable information along this line, recommending the Italian Bees as the easiest to handle, most prolific and generally considered to be the best strain, although the black bee is perhaps the hardier for this climate, but possessing a very ugly temper.

Prof. Brittain had all the equipment necessary for the keeping of bees, to illustrate his remarks. He also showed an observation hive in which the bees could be seen at work and a sample of extracted honey the most profitable way to market this product. The ladies were impressed with the very interesting and instructive manner in which he depicted the possibilities of bee keeping.

Prof. Brittain's address was followed by a series of educational moving pictures, portraying various subjects of interest to all present.

Thanks.

The planning, arranging and conducting of this interesting and inspiring convention was the work of the efficient and untiring Supervisor, Miss Helen McDougall. It was a well planned Convention, harmoniously conducted under her wise leadership. Nova Scotia is to be congratulated on her choice of leader to carry on the indispensable work for Home and Country so well begun in that province by the former Supervisor, Miss Jennie A. Fraser.

Unanimous, therefore, was the vote of thanks tendered the indefatigable Supervisor by Mrs. A. B. Wallace of Hants County, in behalf of every member of the assembly.

The Bible Hill Women's Institute deservedly received a hearty vote of thanks at the hands of Miss Stuart, for hospitality, which helped so materially in making the convention sociable and enjoyable, and thus giving an added zest and a keener interest in the great work that lies within the scope of the women and girls who are banded together for the betterment of home and the consequent upbuilding of country.

MRS. M. A. MacLEOD.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

Our Present Offering in Jerseys is as follows:—2 splendid young bulls, both from R. O. P. mothers, 1 dropped in June 1919, the other in July, 1919. They are beauties and the right sort.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex N. B.

FOR SALE—Ten Pure Bred Yorkshire Pigs, Price $10. unregistered. Apply to WENDELL WARD, WEST BATHURST N. B.

THREE HUNDRED KEGS first quality wire nails, mixed sizes, suitable for repair work around farm buildings and other premises. Price $4.00 per 100 lbs. Apply by mail to "NAILS," care of Office Maritime Farmer, Sussex, N. B.

BREEDERS' DIRECTORY

Our charge for inserting names in this Directory is $2.00 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up. Stamps taken.

THINNING APPLES.

By C. W. ELLENWOOD.

In order to show something of the activities of an apple tree during its season's work and to secure evidence on the need and value of thinning, J. B. Keil, of the Ohio Experiment Station, a few years ago made some careful observations and experiments.

A careful estimate made by Mr. Keil of a Moyer tree nineteen years from planting indicated there were 60,000 blossoms on the tree. About 11,500 finally developed into apples and survived the June drop.

Just after the June drop was over half the remaining apples were removed. Fifty eight hundred apples, or a total of thirty-six bushels, were finally harvested, a good crop for this nineteen-year-old tree.

Counts made on other vareities gave similar results. These observations showed that about one blossom in ten on a tree well laden with bloom is required for a good crop. These observations also show that the June drop does not always remove a sufficient number of apples to permit the remaining fruit to develop good size and quality.

After what seems to be a disastrous spring frost has visited an orchard in full bloom and has apparently ruined the prospects, it is well to remember that if ten per cent. of the crop is still alive this is sufficient for a good crop.

The best time to thin is four to eight weeks after the trees are in full bloom or just after the June drop. Winter apples may be thinned later but the best results are secured by thinning within the period indicated.

The apples ought to be thinned so as to be spaced six to eight inches apart or even farther in the case of large winter varieties. Several years' experience in thinning shows in a large number of cases net gain in quantity while the quality in nearly every case is improved.

The good results from thinning, however, do not all show up in a single year's crop. Large losses from broken branches always accompany heavy crops of fruit and to a large extent this can be avoided by proper thinning. Some trees will set a heavy crop on one side and light on the other. This can be corrected by thinning.

Examinations made in storage on some varieties susceptible to storage scald have shown that the fruits from thinned trees were much freer from this trouble than specimens from unthinned trees.

Nature in many years eliminates enough of the crop to make thinning unnecessary and pruning to some extent serves the purpose of thinning; yet it is safe to say that thinning out to be included as one of the regular operations in an up-to-date apple-orchard program.

HOW TO USE THE COMMON POTATO POISONS.

(Continued from page 743)

not blue. The poison contained is copper aresnic which is near to Paris green, but is more gelatinous, more adhesive and a more rapid killed.

The Bordeaux made in this manner is just as good a fungicide as ordinary Bordeaux. In using the soluble arsenates, one should aim at combining the arsenic with the lime, as arsenates are safe in combination with lime on the potato, while combining an arsenate with copper renders it very low in killing value.

The value of this last formula can be realized from the following: Last year Mr. A. A. H. Margeson, of East Centreville, N. B., used it on his potatoes. On the first application it cost him six cents per acre. On the second application it cost him the same while on the third it cost him eight cents per acre. He secured excellent control of potato beetles and the total cost of his poison for the season was twenty cents per acre.

One pound of white arsenic which costs less than twenty cents, will poison 100 gallons of Bordeaux mixture.

A man can buy his bluestone, lime and white arsenic to make a white arsenic or green Bordeaux for less than he can buy arsenate of lead or Paris green for the same area.

One pound of white arsenic is equal in killing value to two pounds of Paris green, and costs about one-tenth of what two pounds of Paris green costs.

Canada uses about one million dollars worth of Paris green annually. One hundred thousand dollars' worth of white arsenic can be made to do the same work in a slightly more efficient manner.

SUNNYSIDE STOCK FARM

Ayrshire Cattle and Chester White Swine

Present offering: one bull two years old, two aged seventeen months. Also a number of younger ones. Females any age. This herd is bred for production having the combined strain of "Jean Armour" and "White Heather"

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

THE CROW.

The loss occasioned by the crow in Oklahoma led to the study of this bird and the preparation of Oklahoma Station Bulletin 128. A discussion of the damage done by crows, their winter prevalence in Oklahoma, and the location of crow roosts in the state is followed by a brief discussion of their general habits. Studies thus far have shown that grain, peanuts, and pecans are the principal diet on the state during the fall and winter, when available, and at other times animal offal, weed seeds, and insects. From the data at hand it is estimated that at lest 10,000,000 crows were present in the state during he winter and consumed one bushel of grain daily per 1,000 crows, or $1,200,000 worth of grain during the winter.

ELMHURST STOCK FARM

Clydesdale Horses, Hereford Cattle, Leicester Sheep.

We are offering 4 Bulls fit for service, 9 to 12 mos. old. They are good thick, straight bulls fit to head a herd in any county. Prices moderate. We have Rams and Ewes for fall delivery. Write your wants, we can suit you in quality and prices.

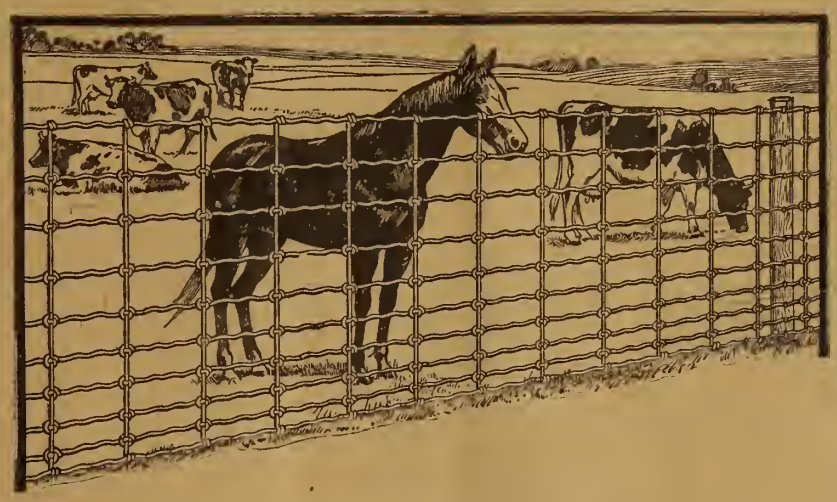
Maritime Fences

Stand the Strain of Man, Beast and Weather



The Maritime Fence is made of extra heavy, hard drawn steel wire of 9 gauge. Each Fence is rigidly tested in our factory, so we know that they have more strength than they are ever likely to need.

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime fence is far longer---and it's wear value much greater.

On the extra quality wire we put a smooth, even, heavy coat of galvanizing. We put on more than enough, so that the greatest strains of time and weather will not impair it. We lock laterals and upright wire rigidly, yet springily with a cross leverage lock that simply cannot let go under the hardest strain. The superior stretching power of No. 9 wire keeps the strands from snapping in the severest frosts.

A Maritime fence is of lasting strength, sightly appearance, and is a necessary improvement on all Canadian farms.

For sale by agents and dealers in nearly every section.

If you don't know the dealer write today to

MARITIME WIRE FENCE

Don't Hesitate About Preserving This Year

JUST think how your folks will miss the fresh fruits next winter! Manufactured preserves will be unusually scarce and almost out of reach, and compared with their cost your home-made preserves will be a genuine economy.

A pound of sugar is enough for three jars of fruit. The increased cost of sugar really makes but a small difference on each jar you put up. On the other hand, the value of the jar of preserves is greater than ever before owing to the increased cost of other sorts of food. Remember that in preserving you get the value of the sugar twice, first as a preservative of your fruit and again as a delicious and nourishing food.

Last year very similar arguments were advanced against preserving, but those fortunate housewives who invested in neat rows of jars filled with a variety of fruits were well repaid for their foresight. The prudent housewife will again preserve as much fruit as her time and means permit.

For preserving the fine natural colour and flavour of Raspberries and all other fruits, buy LANTIC SUGAR in original packages.

2 and 5 lb. cartons
10, 20 and 100 lb. sacks

The "FINE" granulation which dissolves instantly in the hot syrup does away with the long cooking, and it is long cooking that fades fruit. On account also of its absolute purity and high sweetening power, LANTIC is the best sugar to use for all preserving.

FREE—BOOK OF PRESERVING LABELS. Send a Red Ball trademark cut from a bag or from a top panel of a carton, and we will mail you a book of assorted preserving labels, gummed and ready to attach to the jar.

ASK FOR LANTIC LIBRARY

The most complete collection of receipts ever published. Three separate books on Preserves, Cakes and Candies, and Desserts.

ATLANTIC SUGAR REFINERIES, LIMITED
MONTREAL

Lantic Sugar

"The Seal of Purity"

QUANTITY OF SALT TO FEED THE COW.

It has been shown, by experiments, that for ordinary live stock three-fourths of an ounce a day for one thousand pounds of live weight is about the amount of salt required.

However, with the dairy cow it is a difficult proposition. Experiments in which producing cows were allowed to consume salt at will show that they require considerable more salt, in many cases several times as much, as do dry animals. The amount of salt consumed varies greatly with individual cows, and the only system of giving salt that allows for this is where the cows are allowed free access to it daily or have a supply in the manger continually before them.

Another important factor to be taken into consideration is that salt requirements will vary greatly with feed from different localities.. Soil which contains large amounts of salt produce more salt than soils low in salt. The water of streams and wells also varies in salt content. The farmer who keeps salt before his cows at all times need not worry about whether his feeding stuff and water supply contains a high or low salt content.

Barrel salt or compressed dairy salt should be used for salting cows. Never use crystal rock salt. Because of its extreme hardness, it requires too much licking to get enough of the crystal salt, and the sharp edges produced in the rock by the licking frequently cut the tongue severely and cause eating to become a painful process. There is no donger of the animals consuming more salt than is good for them if loose barrel salt is kept before them continually, and they know how much salt they need much better than does the feeder. On the other hand, when supplied in large amounts, at intervals of one or two weeks, as is the practice with many afrmers, there is danger of the animal eating an excessive amount of saft. The excessive amount of salt consumed after being kept from it for some time greatly increases the amount of water secreted in the urine. This causes an abnormal thirst and the animal will then drink large quantities of water which is apt to injure the digestion and lead to other disturbances in the system. Also, when an abnormal thirst for water has been created, and sufficient water is not supplied, the water content of the body will be lessened due to th increased loss through the kidneys. This causes an increased breaking down of protein and results in a loss of strength and vitality.

CROP FEEDING INSTEAD OF SOIL FEEDING.

The resutls of a chemical analysis of a soil do not, as a rule, afford a satisfactory basis for determining manurial requirements. The chemist, it is true, can determine what the soil contains, but no ordinary analysis determines with exactness what proportion of the several elements present is in available form for the crop. Indeed, there is no such thing as a constant ratio of availability. While one crop finds in a given soil all the plant food it requires, another may find a shortage of one or more elements. Further, on the very same field one crop may find an insufficient amount of potash; another may find enough potash for normal growth, but insufficient phosphoric acid; while a third may suffer only from the insufficient supply of nitrogen.

Most of our soils are of mixed rock origin and, as a rule, possess similar general chemical characteristics, providing they have been farmed under usual conditions. The manurial and fertilizer requirements are determined more largely, in most soils, by the crop than by peculiarities in the chemical conditions of the soil.—Massachusetts Experimental Station.

Who Wants Wheat Controlle? Some Stunt

United Farmer's Guide Has Had So Many Versions as to Who Really Wants Wheat Controlled That the Reader May Accept any of the Various Reaeons Given

The United Farmers' Guide is geting into deep water. It is grasping at straws to pull itself out, and in its short life, inspired doubtless by its Winnipeg owners, is trying to explain away a situation, which the Maritime Farmer repeats will cost the farmers of the Maritime Provinces tens of thousands of dollars this year, when they come to pay their feed bills.

This paper, from the drop of the hat, has opposed the control of Canadian wheat by the government, unless the same protection was afforded the farmers of eastern Canada. The experience of the past few months has not suggested any good reason for a change in our opinion.

What are the facts? The western wheat grower, under government con trol, received, first, a boost of fifty cents per bushel in the price of wheat, while not one additional cent was paid for the wheat of the rest of Canada. Second, the western farmer got another boost to $3.05 per bushel for wheet, Quebec and Ontario farmers received smaller concessions, but not one cent of increase was given for one pound of wheat produced in the Maritime Provinces.

What are the results? We have seen the wholesale price of flour in the Maritime Provinces hold at $15.80 and $16.00 per barrel at St. John and Halifax, respectively. There has been no reduction and there will be no reduction because wheat was advanced in price at the demand of western growers, in keeping with the price offered on the Minneapolis market. That market wanted a certain amount of hard wheat for mixing purposes and was willing to pay high prices for a limited quantity. Now flour in the United States is dropping in price and has been showing a steady decline. But in Canada flour has remained just where it was and the result is that Canada must continue to pay the piper. The farmers of the Maritime Provinces are paying a price that has been inflated by the payment of artificial prices for wheat. And as the Wheat Board has also fixed the price of flour, we in the Maritime Provinces must continue to carry the burden. There is no good of blaming the millers. They have their prices controlled by the very same Wheat Board, and they sell for what they are told to.

This is rather an awkward situation for the United Farmers' Guide to explain. Being controlled by Winnipeg and professing to serve two masters—its real owners and the farmers of eastern Canada, it must come across with some explanation. So in its issue of June 30th it blamed the whole business on Mr. R. W. E. Burnaby, of Ontario, and mildly suggested that Mr. Burnably was born in Nova Scotia.

In our last issue we simply remarked that the statement that Mr. Brunaby was responsible was just a plain everyday lie. We suggested that the managing director of the United Farmers' Guide, Mr. George F. Chipman, knew better. We therefore propose to call Mr. Chipman as a witness. In a letter addressed to this paper under date of March 13th, Mr. Chipman, over his own signature (see United Farmers' Guide of April 21st, page 20) says:

"In order that you may have no doubt as to what is the truth I will give you in detail on the five above mentioned charges which you have falsely made for the purpose of creating antagonism against the western farmers.

"1. The Canadian Council of Agriculture at its meeting in Winnipeg on January 5th, 1920, (long before Mr. Burnaby was elected president of the Canadian Council of Agriculture), passed the following resolution which was afterwards endorsed by the three provincial conventions in Manitoba, Saskatchewan and Alberta:

" 'Whereas, the abnormal conditions of the war have rendered its necessary for the governments of importing and exporting countries to exercise measures of control over shipments of foodstuffs, particularly wheat;

" 'And, whereas, possibilities of government control over the grain markets of the principal importing countries of Europe, including Great Britain, still exist;

" 'Therefore, be it resolved, that the Canadian Council of Agriculture while not at this date declaring upon the principle of governmental control as a permanent policy, believe it is desirable to continue national marketing of Canada's wheat product, at least so long as the principal countries importing Canadian wheat retain governmental control of their imports and distribution.'

"This is the resolution which you have used as the basis of your charge that the Western Grain Growers are seeking a fixed price on their wheat for the future to the disadvantage of the rest of Canada. You apparently do not see any difference between 'National Marketing' and 'fixed price' or perhaps do not want to see any difference.

"The fact is that the Western Grain Growers through this resolution asked only that a national marketing system for wheat be continued so long as national buying continued in Europe. They did not ask, nor suggest nor expect that he power of the government was to be used to secure one extra cent above the price that the law of supply and demand upon the world's markets would warrant."

This letter is signed:

"The Grain Growers' Guide,
"Limited,
"G. F. Chipman,
"Editor and Managing Director."

Again in its issued of May 12th, the United Farmers' Guide, on page six, editorially, explains in an innocent sort of way the method of handling wheat and says:

"It appears that the western grain growers will pay this Government Board, instead of other marketing agencies, for handling their grain."

How perfectly plausable this sounds, particularly the "thus is appears" part of it. Mr. Chipman, the managing editor of the United Farmer's Guide, from his close association with the grain growers, knew perfectly well that it has been the consumer who has been paying the way of the Wheat Board, and not the grain grower. So we suppose that it was for this reason that the "shifty" statement of "thus it appears" was made. Possibly it did "appear" from the Guide's version that the grain grower was paying, but every time a farmer in the east buys a ton of feed, or a barrel of flour, he is the one who does the paying.

Then to cap the climax, in its issue of June 2nd, published an article and a telegram from Hon. George E. Foster, representing that no application for government control of wheat has been asked for. It dubbed the Maritime Farmer "The Sussex Annanias" for stating that government control had been asked for. Yet on that very date formal application for government control was made by the Canadian Council of Agriculture from Winnipeg. And at the request of that organization backed up by the resolutions of the grain growers of Manitoba, Saskatchewan and Alberta, government control was adopted.

But the United Farmers' Guide did not stop there. Not content with the control of one article of farm produce to the detriment of all other branches of agriculture, it editorially supported the de-control of mill feed prices and openly advocated eighty dollar bran for the coming winter. However, the government at Ottawa did not go that far and thus were the farmers of the Maritime Provinces protected to a certain extent.

The Maritime Farmer asks its readers which of the many stories told by the United Farmers' Guide they are to believe? If the Guide is right, its managing editor, Mr. Chipman, is wrong. There are his signed statements in absolute contradiction of the Guide's editorial in its issue of June 30th. Which of the duett are we to believe? What game is the United aFrmers' Guide trying to play anyway? What interest has it in advocating that the farmers of the Maritime Provinces be forced to pay eighty dollars per ton and a like in- eighty dollars per ton for bran and a like increase for shorts and middlings, for the coming winter?

The answer is not far to seek. The Guide is controlled in Winnipeg. It wants the last possible cent it can get for the grain growers, who, according to Mr. Chipman, are in favor of holding up prices on their product alone. The Guide, acting under the direction of Mr. Chipman, knows that feed prices this winter will be away in the air, unless a miracle intervenes and so it is trying to break the news as gently as possible.

If the farmers of the Maritime Provinces only realized it, there never was a time when they needed organization in their own interests more than they need it now.

Already harvest excusions, the curse of eastern Canada for years, are being arranged to take still more of our young men west. Our labor troubles are as nothing. Farms in New Brunswick have been sold this year by the score because we have no farm labor. And now we are again to be milked dry for the benefit of the grain growers. We have been passing resolutions for years against the practise, but organization and a united front in our own interests would do more to put an end to this parasite, which thrives on the farms of the Maritime Provinces, than anything else that can be devised.

We ask our readers to weigh carefully the contradictions offered in explanation of wheat control. They need a lot of explanation. It is an insult to the intelligence of our farmers that such rot should be successively printed with the idea of getting away with it.

Wipe the cow's udder and flanks with a damp cloth before milking; this will prevent a large quantity of dust and dirt from falling into the milk pail. Clipping the long hairs on the flanks, udder and belly will make cleaning much easier and faster.

Notes From the Nova Scotia Agricultural College

NOVA SCOTIA CROP CONDITIONS.

The Secretary for Agriculture has received from correspondents in various parts of the province, returns up to July 10th. All correspondents refef to the inadequate rainfall to date, and state that the crop outlook is serious if the drougth continues much longer. With a moderate rainfall during the next few weeks, however, present conditions are such as to warrant the expectation of at least a good average harvest of practically all farm crops.

Hay, which looked very unpromising three weeks ago, is now averaged at 85 per cent. of last year's bumper crop. Last year's hay crop, by the way, was about 25 per cent. larger than that of the previous year. There are some local areas, such as North Inverness, where the rainfall has been unusually light, and the hay is consequently in a very poor condition. Even with the most favorable weather from this out, little more than two-thirds of a crop can be expected in these areas.

Oats and other cereals, potatoes and root crops are reported to be, in the main, well up to the average. With favorable weather conditions during the remainder of the season, these will yield bumper crops.

The apple prospect is variously estimated in different districts from 45 per cent. to 90 per cent., with a general average of 65 per cent. as compared with 1919. It will be remembered that the apple crop of last year was about double that of any previous year for some time back. With respect to apples it may be well to point out that there is sure to be a heavy drop in yield, with smaller fruit, should there be long continued dry weather.

Pastures are reported slightly below last year's quality, averaging 90 per cent., with some districts giving a much lower estimate. Notwithstanding this, creamery managers report an increase of 40 per cent. over last year's business. While some of this gain is due to an enlarged patronage, there is also a marked increase of output from former patrons.

Taking it all in all, present crop reports must be regarded as reasonably favorable, with a very great deal depending upon weather conditions during the next month.

UNUSUAL INSECT OUTBREAK.

The Entomological Division at Truro announces as a matter of curious information an outbreak of an unusual character, whereby a field of nine acres sown to mangles was entirely wiped out just after they appeared above ground. The field was then sown to turnips and those suffered a like fate.

The culprit is a very tiny insect, scarcely larger than a pin point and seldom noticed by the casual observer, although always present in enorgous numbers. It is known as the Spring Tail, taking its name from a rather long apendage to its body which acts as a spring, enabling its possessod to jump about with great rapidity.

The insect is usually harmless, and there is little danger that it will prove to be a new foe to fight. Its ability to do the damage recorded above is due to a combination of circumstances. Extremely dry weather prevailed just as the tender plants were emerging from the ground. This induced a spindly growth and such softness of stem that this insect, with its weak jaws and poor equipment, was able to seat them off at the surface of the soil.

SHORT COURSE FOR 'TEEN AGE GIRLS.

A new venture which promises to be a great success, and certainly opens up great possibilities is the short course in Home Economics, now going on at the Agricultural College under the direction of Miss Macdougall, Superintendent of Women's Institutes.

Sixteen 'teen age girls from different parts of the province are in attendance. Thy lodge in the neighborhood of the College, at pirvate homes and prepare and serve their own meals in the Science building. Thus their instruction takes a most practical form.

The girls are divided into groups, as cooks, waitresses and stewards, these groups interchanging so as to give all experience in care of food supplies, cooking and serving, as well as the use of utensils and equipment.

The course of instruction within the limits of so short a period, covers the preparation of cereals, vegetables, starchy foods, meats, eggs, fish, quick breads, yeast breads, cake, cookies, ices and gelatine desserts, also the canning of vegetables and fruits.

In the evenings social features furnish the main interest. Instruction is given in folk dancig. There are sing songs, tennis and other amusements. The impression of the visitor is that he is in a very busy, happy place where every one knows her work and does it.

A typical menu, picked up at random ,runs thus: Breakfast—Farina, toast with cheese, milk, cauce; dinner—Shepherd's pie, tomatoes, junket ice cream; supper—Cream soup, stewed rhubarb.

The present short course runs from July 6th to 16th. Miss Macdougall is to be congratulated on the interest manifested and the succes already attained. Doubless this is but the beginning of much greater things.

FIRST NOVA SCOTIA EGG LAYING CONTEST.

Report of Contest from Period November 1st to July 9th, 1920.
Hens are number consecutively from 1 in Pen 1 to 150 in Pen 30 (5 birds.)

Pen No.	Owner and Breed.	Eggs produced by hens.					Eggs on Floor.	Total to Date.
1.	E. C. Griffin, R. C. Rohde Island Whites	120	118	73	127	104	28	570

NEW BLOOD IN COLLEGE HERD.

A bull calf has recently been purchased from Mr. B. R. Brown, York, P. E. I., by the college management at Truro. If individual characteristics and heredity count for anything he should prove a very valuable addition to the College Ayrshire herd.

The sire of this, as yet unnamed, young aristocrat, is Fairview Milkman 2nd. No. 47647, whose dam in turn, Milkmaid 7th, holds the Maritime Provinces record for milk production. As a two-year-old she produced 11,673.5 lbs. of milk, yielding 492.75 lbs. butter fat. As a mature cow she is chedited with 17,985 lbs. milk, and 758 lbs. butter fat.

The dam of the calf is Queen's Own, No. 35989, a very heandsome cow, weighing about 1,600 lbs, a show cow as well as a heavy producer. She took first prize at the provincial exhibition in Charlottetown, in an aged cow class number 18 entries. Queen, No 24703, the dam of Queen's Own, now 17 years old, is producing at the present time 50 lbs. of milk per day.

The sire of Queen's Own, Howie's Crusader, 26363, has a splendid record. Besides being a magnificent show bull, an unusual number of his daughters have proven to be record makers.

The young bull will follow along the line of the present head of the Ayrshire herd at the college, Jean Armour Lotus Laddie, and will be mated with his progeny.

THE APPLE SUCKER.

The Apple Sucker, which was first discovered in this country at Wolfville last year, has proven to be more widely distributed than at first supposed. It is another of the undesirable immigrants form the continent of Europe. While the main infection still centres about the point of discovery, it is found in greatly reduced numbers along lines radiating out into parts of Cumberland, Colchester and Hants counties.

The areas in which it has made its appearance are along the North Mountain to Blomidon, whence it has doubtless blown across the Bay, and is found along the Cumberland-Colchester shore from Parrsboro to Bass River. In Hants county there is some infection along the shore from Newport Landing to Tennecape, also along the Midland to Clarkesville and as far East as East Gore and Rodin. The area between Wolfville and Windsor has more or less of it, and it runs along the Windsor-Halifax route almost to Mount Uniacke. Other lines of radiation are directly south of Kentville almost to New Ross, and along the Bay Shore from Hall's Harbour to Scott's Bay.

The only notable damage done as yet is at Wolfville. Tt is only when the insect is present in enormous numbers that measurable harm results. and in these outlying districts it would take several years to multiply sufficiently to be a serious menace. The time to combat it effectively, however, is while the area is comparatively small.

Life history and habits. The Apply Sucker develops from a very small reddish brown egg, which is just large enough to be seen by the naked eye. Hatching takes place in the spring, after the buds have burst, and the young insects immediately penetrate the buds, where they remain hidden and secure against sprays until the clusters open out. They feed at first in the exils of the leaves and in the blossom pedestals, the flattened form of the body enabling them to penetrate quite deeply into these situations. When almost fully grown they come out and feed under the leaf or on the stem. At this time they are green in colour and resemble the aphis, except for their lfatness. They are broadly rounded behind, and provided with small wind pads which give them the appearance of a "spread chciken." The adult has four transparent wings, and is a strong jumper. They feed by sucking the juices of leaf and blossom.

When sufficiently numerous they cause the blossom to wither and die. The leaves are dwarfed, and many of them turn yellow and finally drop off. It is only when present in maximum

numbers, however, that they cause such notable injury. Lighter infestations are scarcely noticeable. The signs of this pest which are most likely to attract attention are globules of whitish, sticky material, secreted by the insects. These gather on leaves and blossoms, and even drip from the tree in severe cases.

Control. The Entomological Division has made exhaustive tests with a view to finding out the cheapest and most effective methods of control. Fortunately they are more susceptible to sprays than many native insects. On the other hand, their habit of penetrating the buds right after hatching makes it impossible to reach them in the early stages. As soon, however, as the blossom pedestals have spread apart and the petals show pink at the tips, a thorough spraying, using as much pressure as possible, with Black Leaf 40, at a strength of ¾ of a pint to 100 gallons of water will readily destroy them.

In very badly infested orchards, a supplementary treatment is advised, in the form of a dormant spray of heavy lime wash, applied just before the buds burst. This wash is made by mixing 100 lbs. of hydrated lime, free from all lumps and grit, 20 lbs. of salt, and 100 gallons of water. The success of this wash depends entirely on the thoroughness with which it is applied. Its action is mechanical, covering the eggs on the small twigs with a coating which prevents them hatching. The best results have been obtained by applying a second coast immediately after the first has dried. The utmost care must be taken to cover the smaller twigs and shoots, as it is in these situations the eggs are located.

If the lime is properly strained and a coarse nozzle used, with sufficiently high pressure, little trouble need be experiencd from clogging. This wash, if proprly applied will destroy 90 per cent. of the eggs. The great advantage of it is that it forestalls any damaging outbreak.

In no case, however, should the Black Leaf 40 spray be neglected. It will clean up the infection, and will always destroy green apple bugs and other sucking insects which may be present.

A full account of the Apple Sucker is now being prepared, with coloured drawings showing the different stages of its life, and its work. This will be available before another season.

HOW TO CONTROL A FARM FIRE.

As an ounce of prevention is worth several tons of fire-fighting equipment, every farmer should realize the great sources of fires and know how to guard against them. The principal causes of all rural fires include: Carelessness with pipes and matches, kerosene, gasoline, burning bresh and rubbish, defective flues, spontaneous combustion, flying sparks and lightning. When a fire starts on a farm it usaully makes a good job of it, and burns until everything combustible within reach is consumed. Fire insurance companies take note of this lack of fire protection, and many will not insure farm property except at righer rates.

It is an amazing fact that 75 to 80 per cent. of all rural fires result in total losses, as compared with but 5 per cent. of the losses in cities. These bare figures mean but little, but when it is stated that in the Province of Ontario, 836 barns burned in the year 1918, each representing an average loss of $1,300, or a total loss of allomt $1,100,000 in cash, we can gain some real idea of the awful ravages of rural fires.

The Fire-Bug Smoker.

The most common cause of rural fires is the careless handling of matches and smoking around inflammable material. Smoking should be absolutely forbidden around barns and outbuildings. And regardless of who it is, the person who enters a barn with a lighted pipe or cigar should be run off the place. He is as great an enemy as an anarchist, and individually far more dangerous.

Fires from kerosene and gasoline explosions are getting common. These combusibles should never be stored inside a building. The best place is underground. The next best is under a bare cover, protecting the tanks from sun rays, out in the open, 50 yards from any building. Lamps should always be filled in the daytime, and kerosene should be used sparingly. It is well to remember that kerosene, although very dangerout, is much less dangerous to handle than gasoline. With the former a lighted match can be dropped in it and no danger will result, as heat is first required to form a gas. But the smallest opening of a gasoline container exudes vapor that is highly explosive, and a spark may carry yards in this vapor to the supply. Being heavier than air, the vapor lies close to the ground, so that it may be a menace little expected.

The great danger from brush and trash burning comes from assuming it is out when there are live coals buried in the ashes. A wind may then rise, blow off the ashes, fan the coal and scatter them to inflammable objects. If care is taken in fully extinguishing all the live embers before evening, the greater danger of spreading fires is done away with.

Testing Defective Flues.

Defective chimney flues play a large part in destruction of farm property. The soot forming in the flue frequently catches fire, and if the flue is not tight, sheets of flame are sucked through the cracks, setting fire to timbers and the room. Practically all the large cities have building laws requiring that flues be tightly lined before the house can be completed. If such a rule is a necessity to safety in the city home, protected as it is by fire engines and a high pressure, inexhaustible water supply, how much more necessary it is that the country home should be at least as well guarded!

Flues can be tested for cracks by building a smudge fire and stopping the top of the chimney. Smoke will quickly emerge from any cracks. These can then be tightly sealed. The flues should be tested at least once a year, and all soot cleaned out.

Spontaneous Combustion.

The most common example of spontaneous combusion is fire that results from the heating of improperly cured hay stored in barns or stacks. If it is a little damp from the rain or dew, it will heat rapidly down in the depths of the mow, gradually work up to the top, and then suddenly burst into flames that are almost sure to destroy all within the barn. Proper handling of the hay is the only preventive, although a thorough salting of each layer of hay at the time it is stored will usually prevent too great heating. But even this will not prevent the hay from molding some and thus spoiling its palatability.

Old dirty rags piled together also may cause fire by spontaneous compustion. Green manure may heat and set fire to buildings, although this is not common. Grain stored away when damp may heat, as will piles of sawdust, and even dirty and oily trash. Knowing the causes and dangers of this source of fires, the remedy is apparent.

The one and only safeguard against lightning is the lightning rod. The number of fires from lightning striking properly rodded buildings is almost infinitesimal, as compared with unrodded. The actual figures show from 89 to 99 per cent. reduction in fires by lightning as a result of using lightning rods of the right kind. No rural home should be considered coflplete without them. But one should make sure that he gets good material and that they are put hp right. Ootherwise they are actually worse than none, and a menace instead of a safeguard.

Wire fences should be grounded every few rods. This is easily accomplished by running a number nine wire at least three feet into the ground at every ten or twelve posts, and stapling it tight over each fence wire. If allowed to extend several inches above the fence, it gives added security. Properly grounded, the lightning, should it strike the fence, will run into the ground quickly, and cause little damage to livestock that may be against it or nearby.

How to Control Fires.

A fire in its early stages is easily controlled. A bucket of rater thrown on then is worth a tankful ten minutes later, which is about the time required to find a bucket, rush to the fump, prime the pump perhaps, and get back to the blaze. The obvious thing then is to have a supply of water near each building. As this is required by fire inspectors in inflammable buildings in the cities, it s surely necessary on the farm. A fine arrangement s to geep a barrel in each main building, filled with water and covered so as to keep out trash and avoid evaporation. Two fire buckets, painted red to mark them, hanging near, and religiously kept there, provide a wonderful "first aid."

Next to a water supply and really more effective in some classes of fires, particularly burning oil, gasoline or kerosene, is the chemical fire extinguisher. These, supplemented by a covered barrel of water, provide material which, quickly applied, will subdue all small blazes before they reach the all-consuming stage. It is equipment such as this that puts out the majority of the city fires.

There is one other very essential accessory to successful fire fighting, and that is a long ladder that will reach to the roof of the house. Without it, one would many times stand by utterly helpless, while a fire from the flue gathered headway and got beyond control.

In fighting fire, coolness and quick thinking are valuable. Headlong dashing here and there, throwing water widely, results in a nine-tenths waste of effort and material. Water and chemicals should be directed at the spot that is actually burning, and not merely at the flames. And it is well to emphasize that water will not put out a flame of oil or gasoline, but only scatters it. These fires must be literally smothered with ashes, sand, sawdust, chemicals, etc.

SAVING HOME GROWN SEED.

(Experimental Farms Note.)

Although the cost of seed that is used in planting a vegetable garden is small compared with the returns, it is very easy to grow the seed one's self and moreover, if pure seed of a good strain is produced at home, one is surer of having what is required.

Seed of most varieties of vegetables can be grown at home of as good or better quality than is the imported seed, but to ensure having good seed it should be saved from the best plants rather than from those which happen to have been left in the garden unused.

A few plants of peas left to mature without picking any green pods from them will furnish enough seed for the garden next year.

Reserve a few feet of the row of beans for seed, or, better still, mark a few productive plants, which are free from disease and do not pick green beans from them. Quickness of drying is important with beans and peas, as with most seed, and it should be cleaned and kept dry until the following spring.

If seed is damp it is liable to mould and lose its germinating power. For this reason it is particularly important in the case of corn to dry the seed thoroughly and rapidly. When corn becomes ready for use, a few of the earliest and best developed ears should be marked to be left until ripe for seed.

One cucumber will contain enough seed for the wants of the home gardener. A specimen which is typical in shape and colour of the variety grown or the type desired should be left on the vine until it turns yellow, when it is cut open and the seeds spread out thinly and dried and put in an envelope until needed.

Seed is readily obtained from lettuce. One plant will produce more than enough seed for home use, and no doubt some radish plants have gone to seed, which may be left until the seed ripens.

The seed of tomatoes for home use should be saved from the plant bearing the largest crop of early and best fruit. The tomatoes are cut in half and the pulp pressed out into some vessel, adding about one-third its volume of water. Put in a dark room until fermentation sets in, which will be in about two days, when the seed will separate readily from the pulp. It is then washed out and spread out to dry but not in the sun. When dry, store in paper bags until needed.

The seed of other vegetables can also be saved, and there are many persans in Canada who have their own specially selected strains of different sorts.

W. T. Macoun,
Dominion Horticulturist.

CO-OPERATIVE WOOL NOTES.

Since our last letter very little change has taken place in the wool market. Possibly the most interesting fatures to be noted since July 1st are: (1) The fixing of a definite date for the re-opening of wool auctions in Australia; (2) the current London wool sales; (3) the shut-down of a number of mills owned by the American Woolen Company; (4) the effects of the trade to forecast the return of confidence; (5) the slight increase in trade activity on the American market.

It is estimated that approximately four million bales of Australian wool will soon be available to manufacturers. This includes Australian wool previously bought by the Imperial government as well as the new Australian clip. Interest is attached to the fact that the Ausralian Prime Minister has announced "that public auctions of the ensuing wool clip will open in Melbourne about Oct. 1st. Heavy withdrawals at recent London sales are leading to the belief that some big movement is on foot to unload large British government holdings on the continent. If such takes place the situation will be materially relieved.

Outside of certain plants owned by the American Woollen Company, there is not much tendency on the part of mills to close down. Every day sees manufacturers and others buying on the American market according to their immediate needs. There seems to be increasd activity in the Western States where many houses now have men in the field taking wool on consignment. Advances on this wool are being made at 20 and 25 cents.

As to this organization, we beg to advise that grading of the eastern clip nears completion. Garding of the western clip is now in full swing at our Weston warehouse. Cars are arriving daily from the west and there is every indication that we will handle considerably more wool than we did last year. The Canadian trade seems quite interested in our grades and speaks very highly of the closer grading being practised this season. We have made numerous quotations and have recently made several good sales of eastern wool at most encouraging prices.

Yours very truly,
CANADIAN CO-OPERATIVE
WOOL GROWERS, LTD.

Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

FARM PAPER FOR P. E. I.

Th farmers of Prince Edward Island are talking of establishing a farm paper of their own, which will be devoted to the interests of the farmers of Prince Edward Island. The idea is a good one. The paper would serve as a stimulus to the splendid co-operative movement which the P. E. I. farmers have built up. They have demonstrated a practical system of co-operation which benefits the farmers. There have been no big rakeofls in their methods of handling goods. They sell their own produce direct and they get all of the profits. It is the producer that benefits and not the few who have money to invest. Likewise, when they buy, it is the customer who derives the benefits. There are no millions of dollars of concealed assets, as is the case of the Grain Growers. That sort of graft has been eliminated in the Island. The Maritime Farmer has been pictured as a paper opposed to the interests of farmers. We have saved farmers of Prince Edward Island this year a good many hundred dollars by assisting them in their buying. We expect in the near future to be able to assist them still further.

The Maritime Farmer wishes the farmers of Prince Edward Island every success in their new venture. We hope they do start a paper, to be dictated along the lines of their own interests.

If the Maritime aFrmer can assist them in any way with its experience, we shall gladly offer our help. What we would like to see are papers run in the interests of the farmers of the Island. There is too much west and too much Winnipeg in evidence in the east today.

A. E. McMAHON'S STAND.

The Halifax Chronicle, in its report of a political meeting at Berwick, N. S., notes the appearance of Mr. Albert E. McMahon, manager of the United Fruit Companies, on the platform with the Liberal candidates. Not content with doing that, Mr. McMahon's speech, as reported, was a direct attack on the United Farmer movement, as at present directed from Winnipeg in the Maritime Provinces. Mr. McMahon said he did not believe in it and he condemned a policy which had as its object the creation of antagonism between farmers and other citizens of Canada. Mr. McMahon needs no special introduction in these columns. He has done as much for organized farmers in Nova Scotia than probably any man in that province. Mr. McMahon will now have to take his medicine, if the organizers from Winnipeg get after him, and if reports that reach the Maritime Farmer are correct, certain persons have already been working quietly with a view to getting control of the United Fruit Companies. Outspoken men like Mr. McMahon are not admired. Independence is something that is not tolerated. Mr. McMahon probably recognized that the Winnipeg game has more thought of political advantage than it has of the welfare of the farmer.

FIGURING TIME FARMER WORKS.

From every industry or occupation, from the shoe shine shop in the village to the Member of Parliament in the Legislative House, the all absorbing topic is a fair day's pay for a fair day's work. The butcher, the baker, the candle stick maker and all the host of per hour per day workmen have it all figured out nicely in black and white and know exactly how they can face their indebtedness and pay taxes, interest, insurance, grocery bills, etc., but the farmer in figuring his income has also to offset his expenses and these must include wages to himself. We do not grudge the laborer his hire nor do we think many of them, skilled and unskilled, are getting more dollars per week for their labor than are necessary to rear families and live in any degree of comfort, but we are certain that if all the skilled and unskilled labor that is undertaken by farm families on farms were paid at the same rate the farmer himself would not make wages for the hours worked.

It is while the farmer is going over his expense accounts for 1919 and comparing items with similar items of previous years that the question arises "What did I get per hour for my labor last year? Was it ten cents, twenty-five cents, thirty cents, or what?" To decide this question he will have to know two things, how much money he made and how many hours he worked during the year. The first, that of excess of receipts over expenses, plus the increase in value of farm and the products consumed by family, is easy to anyone who wades through an income tax statement; but the second is not so easy unless one has kept tab on the number of hours he worked during the year. There were rush times when he worked from 4.30 a.m. to 9 p.m., which, allowing a half hour for meals three times a day, gives him credit for fifteen hours a day. Then there were the stormy winter days, when nothing could be done but chores. There were Sundays and wet days when nothing was done but the chores, and these reduced the total hours he had to work nearer to a civilized figure. But, practically speaking, he was "on deck" all the time, in fact every farmer has to be, from rising time to quitting time.

The farmer who works only ten hours a day and five on Sundays and holidays works 3,375 hours in the year, more than half as much again in time as a union man, and for barely $1,000 at 30 cents an hour. If he is a dairyman he may average twelve hours a day and six on Sundays, or 4,050 hours for little more than half as much money. At times the work day may run to sixteen hours, occasionally even higher. The farmer is constantly "on the job," he can't get away from it. He can't get extra pay for overtime work, but if he doesn't do what needs to be done when it "needs doing," he is liable to suffer serious loss.

It is no use for a farmer to try to check up income and expenditure until he knows what he gets and how long he has worked. He will find it is best to work out the rate of pay per hour (per day is too uncertain a quantity in farming), even if it is only a rough estimate of either income or time. Doing it this way for the past year has guided many men to do it better in 1920. You will not need to use any special form as only the total actual time worked is all that is wanted. Just mark the calendar each day and you will get the total of your time from that at the year's end.

A REAL TEST OF A BULL'S VALUE.

In selecting a bull, the most important thing to consider first is his breeding. This means that he has a good pedigree. His dam and grandams should be good producers. He should come from a family of consistent producers. Pedigree, however, is not everything.

The bull must be a good individual. Many a bull with an excellent pedigree is occasionally so poor an individual that no good breeder would use him. Type is essential if we ever expect to sell any of the offsprng. As far as young bulls are concerned, breeding and individuality are all we have to judge from. With a bull four years old, however, we should have another index of his value.

Good offspring is the real test of the value of a bull. His ocspring should show uniformity and be good individuals. The daughters should also be good producers, at least as good as their dams at the same age.

If a bull has these three qualities he is a good bull. If he possesses the first two and it turns out that he does not have good daughters, he is no good and should not be used longer. If on the other hand, his daughters prove to be better producers than their dams, you have the kind of a bull every breeder is looking for—one that builds up the herd.

* * *

The time has come when the dairy farmer, producing milk for city trade, who wants efficiency cows must breed and raise them. If he depends upon buying new cows to replace the onces discarded from his herd he will never succeed in getting any further ahead. In order to raise efficient cows he must adopt a system of breednig and selection and stick to it until the desired results are accomplished.

* * *

In many instances crop returns could be increased considerably if a more complete job of harrowing were done and if more cultivation were given where this is possible. Labor spent in this way is seldom lost. As stated, Nature makes an effort to respond whenever the soil is stirred. If the response is not evident it behooves one to locate the circumstance which is restraining Nature from showing just appreciation of one's effort to assist here.

* * *

Education should lead to understanding; should prepare one for some useful service and should make one more efficient, so that he can do more work than th person who has not had the school training. It should lead to a desire for useful knowledge, a desire to read good books and magazines, because the mind does not grow unless it is fed properly. Education should lead to higher standards of living and to higher ideals.

BOYS' JUDGING COMPETITION.

The first boys' judging competition to be held under the supervision of the New Brunswick Department of Agriculture took place July 6th and 7th. This was the ultimate result of agricultural short courses which were held during March of this year at Chatham and Moncton, under the superivision of the gricultural representatives. The courses were of 2 weeks' duration, and were open to young men interested in agriculture. Instruction was given in all lines pertaining to agriculture including stock judging. At the conclusion of the course, three boys were selected from each 10 to make up a team to compete in the contest between the two short courses. This was held July 6 and 7th, when the teams and instructors, accompanied by E. P. Bradt, Secretary of Agriculture, and F. W. Walsh, Acting Supt. for Livestock, motored to Napan Evxperimental Farm, where most of the judging was conducted and the following classes judged:

Draft brood mares.
Beef cows.
Dairy cows.
Dairy calves.
Breeding sows (bacon type).
Butcher class hogs (bacon type).

The following day the Oxford sheep flock, owned by Burden Goodwin, Baie Verte, Westmorland county, was visited and two classes were judged: Breeding ewes and butcher class lambs. Written reasons were required in all classes and although the boys had not had a great deal of training, their papers showed that they had grasped the work exceedingly well. The fololwing is the result, giving individual scores and team results:

1st, John Bateman, Shediac, West. county, 684.

2nd, Fred F. Fowlie, Little Branch, Northumberland county, 647.

3rd, Willie Trueman, Aulac, R. R. No 3, 643.

4th, A. McDougall, Hexhan, Northumberland county, 637.

5th, Blair Collier, Moncton, R. R. No. 2, 561.

6th, John Beattey, Nash's Creek, Restigouche county, 504.

1st—Moncton, 1888.

2nd—Chatham, 1788.

A silver cup was offered for the team having the highest score and this goes to the Westmorland team.

Prizes offered for the highest individual standing were two books, "Types and Breeds of aFrm Animals," by Plumb, and "Judging Livestock," by Craig. John Bateman, Shediac, received this. Second prize, a book, "Judging Livestock," was won by Fred Fowlie, Little Branch, Northumberland county. Although this is the first contest of this kind that had been held in New Brunswick it proved a success, and opened a way for more work along this line. It is hoped next year will see a larger number of teams compete.

Special mention is due to J. H. King, Agricultural Representative, Moncton, and Jas. Bremner, Jr., of Chatham, who instructed the teams.

In accordance with the policy adopted by the Women's Institute Division of the New Brunswick eDpartment of Agriculture, demonstrators will, during the summer months, visit each and every Institute in New Brunswick.

For the past few years the maporify of the demonstrations given were on cookery, with occasional ones on home nursing and dressmaking.

Requests for more information concerning home nursing led to the decision to send out a nurse as one of the demonstrators for the 1920 summer campaign. For this purpose the department fortunately secured the services of Miss Alice Landry, R. N., who did such splendid work in the Women's Institute Short Courses in Household Science in both English and French speaking districts of the province.

Miss Elizabeth Nutter, graduate in Household Science from Acadia Seminary, Wolfville, N. S., who has so efficiently conducted oWmen's nIstitute demonstrations during 1918-19. will again visit the Institutes, demonstrating vegetables—food values, practical uses and methods of preservation.

POTATO SPRAYING ECONOMY.

(By J. A. M., Ashton, Ont.)

With the present scarcity of efficient labor or in fact labor of any kind, it is predicted from many quarters that the bugs and the blight will have an unlimited opportunity to play their destructiveness on our already highly expensive potato production. Indeed if this should happen the lowly spuds might be again at a premium during the coming winter, and the growers in general be at an enormous loss. The writer is aware of one who last season planted fourteen bags of the cobblers and only dug sixteen, an increase of only two bags; it is quite apparent that should the increase have not been more than doubled it still would have meant loss; this failure was chiefly caused by not spraying for blight; it is acknowledged that the farmer was busy at the time and did not feel disposed to stop his harvest work, but it is easily seen that it would have paid him to hire help if it was at all possible to secure it. Now at the outset of this article it was intended to investigate the means by which the spraying could be done in the most efficient manner at the lowest possible cost, because that is the fundamental principle of economy. As to efficiency in the matter of Colorado beetle destruction, I can revert to a period when they were viewed as a very poisonous insect, and shortly after that there appeared an advertisement in an American paper as a sure remedy for them had been found; now this only cost fifty cents although that amount is worth about as much in buying powers as three dollars is today; so off we sent it by registered letter, and in a few days arrived the sure cure for these bettles; it consisted of two small blocks of wood numbered one and two; the directions read something like this: "Remove beetle from foliage, place on block number one, and then tightly press no two against it; scrape clean and proceed as before.' 'Undaunted by this first potato fraud we purchased some Paris green to afterwards learn that it was unsafe to apply it to the leaves as it would poison the potatoes and finally ourselves; so with our usual presence of mind we mixed up a pailful of the mixture, picked off the bugs and threw them into it. After this came the brush method of applying the green, then the watering can and finally we are in the era of the sprayer, which to the present moment has furnished the most scientifice method of applying all kinds and varieties of spray mixtures. Unlike the watering can the liquid is omitted from the sprayer nozzle under high pressure in the form of a fine mist which has the capacity of entering the most slender crevices and the most remote corner of plant foliage, and of buildings, etc., when used for disinfecting and other purposes. This film-like liquid spreads over the entire foliage and dries thereon resulting in the most satisfactory results that are possible to be attained. Besides this only about one-third the water, and half the Paris green is used, with a comparative saving in the consumption of all other materials for different infections. There are three standard varieties of sprayers whose efficiency is about equal and the results identical, the only material difference being that according to size and style they are suited to variously sized plots, and the second consideration arrives in should one desire their use for other purposes than spraying potatoes. The smallest implement is what is known as the shoulder tank; this tank holds a few gallons and air is compressed into it by a hand pump which is a component part of the machine; as one walks along the rows the mixture emerges from a pipe connected to the tank; thus by manipulating this rubber pipe or hose it is possible to spray all kinds of small vegetables and shrubs, disinfect stables and barns, does small amount of whitewashing, besides look after the potato plot. It is well suited for small areas of perhaps an acre or so, but over that the two-row sprayer is by far the most economical as it sprays two rows at a time and does not require to be filled with compressed air; the tank of this I would imagine would hold possibly about eight gallons so one can readily see that it will cover quite a space without being refilled. It is a very handy little machine for washing the buggies or car, windows, or giving the buildings a coat of whitewash. It has been used with good success for large acreages up to ten or twelve, but as time is valuable during the spraying season it is merely a matter as to whether that amount of time could be utilized, because if the area is over three acres the four-row sprayer certainly will accomplish the work in less time with very infrequent refilling as it holds a barrelful; it can be easily appreciated to be a much swifter outfit, and is especially adopted, by the use of a small extra attachment, for orchard spraying as well as other miscellaneous work. The writer is aware of a party who sprays nine acres after supper and his supper was not very early either. It is quite feasible to cover the ordinary sized plot of a grower who does not specialize in production of potatoes, of say about five acres, in two hours or so. It is well when purchasing to buy a size suited to your requirements as many who first bought a smal lsprayer, after finding out the exceptional qualities of the work done, have wished that they had purchased a laregr outfit and gone more into the business, as they claim that by the spraying method the work is reduced to a minimum with almost a certainty of a good crop, as the entire field can be covered just as frequently as required without the dread of a back breaking job. In some sections the four-row sprayer is used for applying iron sulphate to growing crops; this will destroy any wild mustard that may be in them, and it has been found to give very satisfactory results by various persons, although the writer personally has had no experience with the spraying for destruction of mustard. The large machine is, of course, horse drawn, and the two-row apparatus can either be pushed by hand power like a wheel-barrow, or also drawn with a horse. During this labor scarcity, and the general prevailing high prices of potatoes for the last few years, the sprayers should materially increase the annual yield, and prove to be one of the most necessary and best paying pieces of machinery around the farm premises. The Dominion and Provincial oGvernment Departments of Agriculture have prepared some very good information on potato, vegetable, and fruit spraying, which can be had for the asking, or one can also secure this from a sprayer manufacturing concern without charge; the latter generally gives you a small booklet on the subject when you purchase a sprayer.

ACADIA UNIVERSITY
WOLFVILLE - - Nova Scotia.

Departments
Arts and Sciences. Applied Science. Theology.

Degrees
B.A., B.Sc., B.Th., M.A., and certificates admitting to the best technical schools. First two years in Agriculture given as electives in B.Sc., course. First year in Medicine, Law, and Theology given as electives in B.A. course.

Equipment
Largest undergraduate faculty in the Maritime Provinces. Three new and splendidly equipped Science Buildings. Modern gymnasium and physical training.

Expenses
Expenses light, and over $2,000.00 given in prizes and scholarships yearly. Send for calendar to

Rev. GEORGE B. CUTTEN, Ph.D., D.D., LL.D., President.
Next term begins September 29th, 1920

ACADIA LADIES' SEMINARY
WOLFVILLE - - Nova Scotia.
A Residential School

The Aim.—To prepare Girls and Young Women for Complete Living.
The Courses.—Twelve; including College Matriculation, General, Music, Art, Expression, Household Science, Business.
The Faculty.—Twenty-four Teachers of fine personality and Special Training.
The Equipment.—Modern and First Class in every respect.
A Junior School.—For Younger Pupils.
Information.—Write for illustrated book to

Rev. H. T. DeWOLFE, D.D., Principal.
Next term begins September 1st, 1920.

Acadia Collegiate and Business Academy
A Residential School for Boys and Young Men
Ninety-Second Year
Courses.—Collegiate, Manual Training, Business, Special Courses.
Features.—Modern Residence, Good Equipment, Ideal Location, Splendid Environment, Modern Gymnasium. Experienced Teaching Staff, Moderate Cost.
For illustrated Catalogue of information apply to

Principal W. L. ARCHIBALD, Ph.D.,
WOLFVILLE - - Nova Scotia.
Next term opens September 1st, 1920.

HORTICULTURE.

A STRAWBERRY SUCCESS IN NOVA SCOTIA.

By J. H. McDonald in Farmers' Magazine.

Growing strawberries of first class quality, putting them on the market with the flavor still as fresh as it was in the field and creating a demand for them in the local market at a price that guarantees more than an ordinary profit is the achievement of John Huntington and Sons, of Salmon River, N. S.

When John Huntington began experimenting with strawberries, a number of years ago, he had a first-class stock farm and four sons to help him. He was looking for a cash crop that could be carried to market over twinty-two miles of bad roads without having all the profits leak away in wagon and harness repairs. This was before the boat-line on the Mira came into being and brought the market for heavy produce close to the gates of the farmers of this section.

Potatoes were out of the question for they were too heavy. No one had ever attempted to grow small fruits on a commercial scale in this section. But Mr. Huntington had gooseberries, raspberries and strawberries in his kitchen garden, and he knew they did well on a small scale.

He selected the strawberry. Having grown strawberries in the garden on a small scale, he was spared several of the many mistakes of those who go into such a venture "with both feet."

The farm itself is on a low hill in a bend of the Salmon River. On three sides of it are the marshes on which many tons of wild hay are cut each year, ideal material for a winter mulch.

The first year the plants were set out on sod turned under the fall before. They were carefully planted and cultivated and the soil was well fertilized, in fact as far as his knowledge of the work extended no pains were spared to make a success. However, th previous year the May beetle had laid a gooodly supply of eggs in the sod land ant during the summer months the white grub paid full attention to the juicy roots of the new strawberry bed. When fall came only a small percentage of the plants had survived.

This was one lesson learned and a mistake that did not occur again. It has been this role of only making the same mistake once that has helped, more than anything else, to bring "Huntington's strawberries" into suih local fame as they at present enjoy.

The writer has "talked strawberries" several times to one or other of these men and they say that doing the work thoroughly from start to finish is the secret of their success. This is how they go about it:

Cultural Methods.

The land is always in a hoed crop the year previous to setting out the plants. Usually it is potatoes and the soil is heavily fertilized with barn yard manure. The more humus the soil contains the better it is from a strawberry point of view. No commercial fertilizer that has yet been tried here has given as good results as manure. If applied in the spring, well rotted manure is the best. Fresh manure applied in the spring leaves the soil too loose allowing it to dry out more quicqkly. This is more apparent on lighter soils. The south side of the Huntington farm is rather a sandy loam, while the north slope of the hill is a heavy clay loam. Nitrate of soda, applied at the rate of about one hundred pounds per acre at time of flowering, has been found to give good results.

The land for the new plants is well worked as early in spring as possible. While plants may be set out in the fall and give fairly good results, it is found that spring is the time for ploughing. The treatment the soil receives prior to setting out the plants has a lot to do with the ultimate success or failure of the plantation. Thorough discing, followed with a smoothing harrow and a light roller will put the soil in good mechanical condition. The use of the roller gives the soil a level surface that is a great help toward getting all the plants set at the proper depth.

In planting, the matted row is the only system used. Other methods are left for the experimenter. Special methods may at times give a heavier yield but for economy of time and labor the batter row is found best.

The rows are set three feet and a half apart and the plants about twenty inches apart in the rows.

After planting is over cultivation is commenced at once. An effort is made to keep a good dust mulch on the surface. All weeds are kept down. All blossom stems are pinched off as soon as formed, the plants are forced to direct all their energies toward leaf and runner growth.

Considerable care is taken to have the runner plants well spaced and not overcrowded. With such heavy runnering kinds as Warfield, a few are cut off if there are too many.

In the late fall after the ground has frozen solid the winter covering is put on. For this, heavy marsh hay from the adjoining marshes is used. This is put on to a depth of from three to four inches. The marsh hay is considered the best material for covering as it carries no weed seeds to pollute the soil. The Huntingtons have never used any cover crop between the rows as such a crop draws too heavily on the supply of fertilizer and moisture. The mulch prevents much of the alternate thawing and freezing of the soil in spring. It is left on the rows until all danger of hard frost is over. It is removed before growth starts. It also prevents too early a start being made by the plants in the spring and

ADJUSTING CULTIVATOR TO ITS WORK.

Many farmers pay little or no attention to the proper adjustment to the shovels of the cultivator. They assume that the culivator is all right if it is going through the ground reasonably well and is tearing up the weeds. But it may be doing poor work, and at excessve labor to both team and operator because of faulty adjustments.

The points to be observed particularly in adjusting are: lubrication, balance of frame, position of seat, hitch, spacing and alignment of gangs, feiders or shields, springs and depth adjustment, and shovels. Too many operators ignore all of these except that of the shovels, and adjust the latter very poorly. It should be unnecessary to state that the cultivator wheels should be well lubricated, as well as all the other parts, if the cultivating work is to be done with the least effort of man and team.

The Proper Balance.

In most of the latter types to riding cultivators there are adjustments for balancing he weight of driver against that of the implement, so as to get just enough weight at the end of the tongue to hold it from tipping up, and still get no appreciably weight on the horses' necks. This adjustment will need to be changed whenever a change of operation makes a marked change in either the weight on the seat or the position of the seat, as the latter is moved back for a tall man or forward for a short man or boy. Care should be taken that, with the gangs down in position to work, the driver can just tip the tongue a trifle by leaning far back in the seat. If the driver wishes to use the implement as a walking cultivator, he should try, either by a readjustment of the balance or by putting a weight on the seat, to make up for this change in the distribution of the weight.

Two things should be kept in mind in adjusting the hitch on a cultivator. One is to hitch the single tree to such a height that the horse can pull the load with the least draft and the greatest comfort. In general, the sigle tree should be at such a height that it will be on a straight line extending from the shovels in the ground to the point where the traces are attached to the hames. This is more nearly the natural pull for the horse than to have the single tree at such a height as to make the traces horizontal.

The other thing to be watched is the point where the draft is applied to the gangs. On some cultivators there is a vertical clevis adjustment at the front of the gangs, so that by hitching higher or lower, the gang will run shallower or deeper in the ground. The proper adjustment here will make consideable difference in the labor of getting the shovels to run at the desired depth.

Gang Adjustments.

The gangs should be adjusted first to the proper distance apart. Obviously they will need to be closer together the first plowing and wider apart after that. In some models, especially of the two row types, the gangs are spaced by means of a lever. In others, this spacing must be done by loosening a set screw and moving the front of the gang in or out along the axle. Whatever the method, it should not be neglected, but care should be taken that when the gangs are the proper distance apart the gang beams should run parallel.

Many cultivators also have an arrangement whereby the shovels are held perpendicular to the row no matter how far the gangs are pushed to one side. and occasionally this will need checking up to see that it is in proper adjustment.

The gange should also be so adjusted that the shovels will run at the proper depth with little or no pressure from the operator. The depth is really a combination of several factors, such as spring tensions, hitch at front of gang, sharpness of shovels, nngle at which shovels are set, and so on.

Shovel Adjustments.

Above all things the shovels themselves must be kept properly sharpened and scoured. No money spent for repair work will bring better returns than in having the cultivator shovels pointed and sharpened and polished each spring, and some heavy grease or oil should be kept with the implement constantly and a little applied every night to be sure that no rust collects.

It is also important that the shovels be set at the proper angle and that this be uniform on all of them. In some cases his angle is fixed, but in most models there is some adjustment whereby it can be varied slightly.

It is hardly possible to give any figures which will apply to all implements and all conditions, as the best angle will be affected by the length of the shovel, the amount of curve it has, tie charactr and condition of the soil and so on. Obviously, the best angle may be changed slightly on the same cultivator by a difference in the length and curve given to the point. By trials, however, the angle for the best results can be determined, and the shovels can be set to this angle in lase they become loosened.

If difficulty is experienced in getting a sharp shovel to penetrate, setting the blade to run a little flatter should give a little more suck and overcome the trouble. If set too flat, however, it will not penetrate so well. Shovels set too straight up and down usually will jump or skip along and will require more effort to hold them in the grohnd and hence cause heavier draft. Under such conditions they usaully will not scour well.

Also the shovel must be set to throw the dirt properly. If the inner shovel is set to throw the dirt towards the rows, the tendency will be to crowd the gangs out, and the outer shovll should be set to throw the dirt slightly in the opposite direction, so that the gangs will tend to run practically straight. If anything, it is better to have the gangs crowd out a little rather than in. as this tendency can be overcome with the link or chain connection between them without throwing undue work on the operator.

Where the shovel persists in working loose on the shank, a steel lock washer put under the nut will stop all such trouble.

Strikes, strikes, strikes in the city for shorter hours and higher pay, bewailing the high prices of food and all other necessities of life, but with plenty of money for luxuries, present a unique and unusual situation—the aftermath of war.

Buy Roofing
With your eyes open

When you buy ready roofing you should bear in mind the following facts.

There are many kinds of ready-roofing on the market.

The prices of these vary, *depending largely on the quality*. Although the quality influences the price, there is small difference in the *outside* appearance of these roofings.

So you cannot determine quality by outside appearances alone. You must judge a roofing by its price and by the service it has given others.

There is only one roofing legitimately sold under the name of Ru-ber-oid. This roofing costs more than some others. Its quality justifies its price. On many roofs it has given continuous service, without repair, for over twenty years.

If you buy roofing simply from the standpoint of low first cost you are not interested in Ru-ber-oid.

If high quality and long service are what you require you should buy Ru-ber-oid.

The Ru-ber-oid Man appears on every roll. Remember this because the name Ru-ber-oid is often wrongly connected with roofings which are even more inferior to Ru-ber-oid in quality than they are lower in price.

DAIRYING.

MANAGEMENT OF DAIRY HERD—HOW TO MAKE IT PAY.

The subject of managing a dairy herd has a great bearing upon the future of the business. The demand for dairy products in the form of whole milk, butter, cream, cheese, condensed milk, etc., is stimulating the business of dairying. The dairy business is also proving the salvation on many farms where a too one-sided system of crop growing, without the necessary provision for plant food, has rendered the land unproductive.

Years ago, when the land was new and the fertility seemingly adequate to last for centuries, farmers did not recognize the importance of feeding live stock and returning the fertility to the land, but today the farmer is finding it necessary to help nature to sustain life in the soil if he is to succeed in doing his share toward feeding a hungry world.

The statement that two-thirds of the dairy cows in Canada do not make a profit for their owners leads us to sit down and do some mighty hard thinking and start out with a determination to weed out our own herds and send every inferior animal that is not able to pay for its board to the shambles. With land valued at from $100 to $150 per acre it requires no close figuring to convince us that we cannot afford to decorate our pastures and fill our barns with scrub cows that eat their heads off and fail to say "I thank you" for their food.

To Clean Out Robber Cows.

How are we farmers going to set about the problem of cleaning out the robber busines on a basis that will pay us the customary ten per cent. profit for what we do for them? Now, we cannot go into every cow stable and sell every cow that it not a high producers and put in their places a few purebred animals, and then go to our bank and start making heavy deposits. A lot of us would be worse off with purebred dairy cows than we are with our grade herds, because we would not have the experience necessary to care for and feed them so as to bring out their best qualities. The desire to own purebred stock is praiseworthy, but unless a man is thoroughly qualified to care for them they will prove as useless, and far more expensive than vigorous grade animals. Always bear in mind that scrub feeding and scrub care will make a scrub out of the best purebred animal in the land.

The Number of Cows to Keep.

I have no purebred cattle on my farm at present, neither have I the most convenient barns and equipment like many of the wealthy farmers in the state, but we are endeavoring to do the best we can with what we have and with the feed we can raise, and to bring our land up to a higher state of fertility. With better cows and the growing of silage corn, oats, clover and alfalfa, and feeding them out on our farm we hope to build up a better system than the one we are now practising.

My advice is not to keep more cows than you can give proper care and sufficient feed. Do not think because your milk check, cream check, or whatever it may be, is a large one from a herd of 20 cows that you cannot make a greater profit by cutting down the herd to ten of the real good cows and giving the ten cows better care, better feed and growing better crops adapted to their requirements. You may get a smaller check at the end of each month but you will have more money at the end of the year if you feed only the better producers. It is not always the large herd that makes the most profit.

Use better sires, raise the best heifer calves from the best cows and give them the best of all calf-foods—skim-milk. I do not know of a single instance where a dairy farmer has succeeded in raising good thrifty calves by feeding them water and prepared salf meals. These calf meals come near to being a substitute for skim-milk, but they do not give good results unless they are fed along with skim-milk, which is necessary to promote growth and build body tissues. Proper development of the calf is one of the prime essentials of developing a high-producing dairy cow. It is nothing less than a disgrace to the dairy industry to visit farms where the calves are neglected and see the poor, scrawny little creatures humped up in fence corners. Such stunted animals can never develop into high-class cows, no matter how well they may be fed and cared for after they reach maturity.

How to Feed the Heifers.

We must breed and feed so that we will have yearling heifers that weigh between five and seven hundred pounds without carrying an excess of fat by the time they are one year old. Then we will know that there is some chance of our making progress in the way of develpoing a profitable herd of cows. In my exerience in feeding calves I have found ground coats, with the hulls removed, an excellent feed to mix with skim-milk, gradually teaching the calf to eat the dry grain and hay. A little grain is needed to keep them growing until they are a year old.

So much for the calves, now for the time when the calf becomes a cow. Is she going to be properly developed to pay for all you have done for her? That is the big question. If she had a good sire for a father and a fairly good cow for a mother, the rest is up to you. If she has good care the chances are that she and her offsprings will be worthy o a place in your herd.

The day of guesswork in feeding the dairy cow has gone. If we are to make a profit from our herds we must fix certain standards and do our best to bring each animals up to them. We must figure out well ballanced rations by using what feeds we raise on the farm, with the addition of such feeds as may be needed to properly supplement them in making up the required amount of protein.

The Minimum 6,000 Pounds Per Cow.

Every dairy fairmer should breed and feed for the six thousand pounds of milk per year per cow at least, weigh her milk at least once a week and keep a record o fher butter fat yield. The scales and Babcock test will prove of untold value in keeping you posted regarding the production records of the individuals in your herd. If some of the cows should fail to produce the six thousand pounds of milk a year take an inventory of your methods of care and feeding and if

Manufacturers of Shinn-Flat Lightning Rods
120 Woolwich St., Guelph, Ont.

"The Kind That Are Guaranteed."

Lightning Can't Strike if Shinn Gets There First

you are thoroughly convinced you have done the best you can by them, sell them to the butcher.

Grow all the good clover and alfalfa hay that you can and enough good corn to fill a silo. If you have for grain you can keep production enough land to grow corn and oats costs down very low. We musa balance our feeds so that the cows will be furnished the required amount of digestible nutrients to supply her own body needs and the extra feed require dto maintain a profitable flow of milk. With a properly balanced grain mixture it will seldom pay to feed more than one pound of grain for every three or four pounds of milk the cow produces. The following rules in the care and managefent of the herd will prove of value to many farmers who are new in the business.

1. Keep as many cows as you can properly feed and care for.
2. Use pure bred sires and raise only the best heifer calves.
3. Use the scales, Babcock tester and pencil.
4. Grow as much of your feed as possible.
5. Provide a comfortable and sanitary stable.
6. Feed all the good roughage they will eat up clean.
7. Have faith in your cows and in the dairy business.

T. J. ROBERTSON.

BLOOD IN MILK.

Please tell me what causes my cow to give bloody milk as she seems to be healthy. Calf is three weeks old. Her milk is bloody only at the last of each milking. W. H. H.

It is quite common for blood to occur for some time in milk of a newly calved cow. Heifers with their first calf are often affected. Congestion or gorging of the mammary gland with blood causes rupture of minute blood vesels so that bleeding, severe or slight, results. As a rule this condition soon subsides and that may be hastened by feeding a very light ration and giving a handful of Glauber salts in feed or water two or three times a week. In persistent cases, however, it may become necessary to bathe the udder with vinegar and water or alum solution two or three times daily and give one dram of dried sulphate of iron and three teaspoonfuls of salt in the feed twice a day until bleeding ceases. In old standing cases, affecting but one or two teats, growths in the milk ducts are the usual cause, and if they cannot be removed by operation, the cow should be alolwed to nurse calves or should be "dried off."

ABORTION.

I am just a little afraid I have contagious abortion in my herd and would like to know just how it affects, and how long it will take to stamp it out if $ have it, and just what steps would you advise taking? I am thinking of buying six or eight Holsteins this summer and expect to have to pay a very high price for them and would like to be sure I have no abortion on my farm before adding such costly stock to my herd. F. M. K.

If you care to give us full information regarding any trouble you have been having with your cows, we shall be glad to give you advise. There is no specific remedy, as yet, for the contagious abortion disease but a herd can be cleaned up in time by having each affected animal treated by a specialist in sterility and abortion work. Affected animals meanwhile should be isolated and the stables, cleansed, disinfected, and whitewashed. For a full discussion of the disease, read bulletins on the subject which you can obtain free from teh agricultural experiment sation of your state and the Department of Agriculture, Washington, D. C.

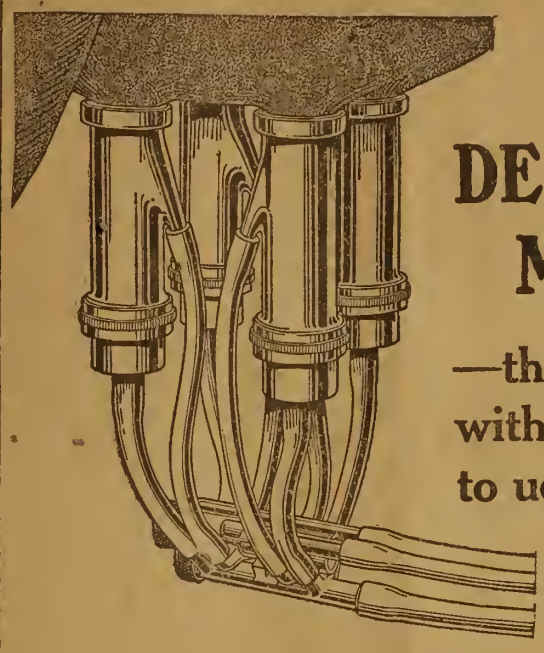
DO NOT OVERFEED THE SKIM-MILK CALF.

"Overfeeding," says C. H. Eckles. chief of the dairy husbandry division of the Minnesota College of Agriculture, "is probably the most common cause of lack of success in raising calves. It is a mistake to assume that because the cream has been removed the calf needs mor milk or that because the calf is not doing well it is not getting enough milk and should be allowed to gorge itself. A good rule is always to keep the calf a little hungry. Some provision must be made for making certain that each animal gets its share and no more. A satisfactory plan is to tie the salves in small stanchions during the feeding. Each calf then gets its proper amount and cannot interfere with the feeding of others.

"Under natural conditions the calf takes its milk frequently and in small quantities. When fed by hand, two feedings a day is the general practice and special care must be taken not to allow the calf to consume more milk than it can digest. For the first tow weeks 10 to 12 pounds a day is all that the largest calf hould receive. If it can be done without too much inconvenience, the calf at this age should be fed three times rather than twice daily.

"As the calf grows, twice-a-day feedings are sufficient and the milk may be increased, but at no time is it necessary to feed more than 16 or 18 pound daily. By the time the calf needs more than this amount, it will take the additional feed necessary in the form of grain."

Since agriculture is our most important industry, why should not every boy and girl be taught somethings about it?



THE DE LAVAL MILKER

—the only Milker with pulsator close to udder

Among the many new and exclusive advantages in the construction of the De Laval Milker, particular attention is called to the Udder Pulsator and the teat-cups.

The Udder Pulsator is located within a few inches of the cow's udder, which insures positive and snappy action in the teat-cups. The action is uniform, gentle and pleasing to the cow. The only moving part in the pulsator is a small, plain piston which requires no oiling, adjusting or repairing.

The De Laval teat-cups are self-adjusting and made in one size only, which fits all teats. The construction is so simple that they can be easily taken apart, cleaned and put together. Every other part of the De Laval Milker is equally simple, practical and efficient.

LIVE STOCK.

THE LAWS OF HEREDITY IN ANIMAL BREEDING.

During the last hundred and fifty years the development of the various breeds of live stock has been one of the great triumphs of agriculture. Strange as it may apepar, the advance has been made without the application of scientific principles. Rather, it has been the result of the application of the breeders' art, a body of lore and experience handed down for generations among the breeders themselves. Back of all this lore, however, there lay a large number of unexpressed scientific principles which have only been formulated recently, and which are guiding the action of the advanced breeders of today. Many of the great breeders, acting by intuition, broke away from tradition, when they began mating animals of close relationship, possesing the qualities they desired to improve, a practice for which science has provided an explanation.

These old breeders were, however, handicapped by many age-long traditions which must have caused them at times severe disappointments and discouragements.

The old-time breeder believed that in mating two animals the cross shows a blend of characters. Whenever exceptions occurred they were treated as exceptions,but Mendel showed clearly that blends do not always occur, but that frequently one member of a pair of characters dominates the other members.

Again, breeders did not understand the resutls when crosses were mated. Instead of blends some of the progeny will show the characters of the paternal grandparents, some of the maternal grandparents, and some will be like the parents.

further, modern hereditary takes no cognizance of the theories of telegony and maternal impressions which fill the pages of the history of breeding. The modern breeders have been freed from such impediments, so that with the new conditions greater improvements may be expected in coming days.

We are often asked: "What have the new principles of heredity done for the animal breeder." A full answer to this question would require many pages, so a short statement must suffice at this time.

The laws of Mendel lie at the base of all modern scientific breeding of both plans and animals. As they have only been known for twenty years, their applications have been made to but a few phases of stock breeding. The essence of these laws is the important fact that the quantities or characters are inherited independently of one another and that these appear in a certain definite ratio in the second and following generations. For example, if a horned bull is mated to pure polled cows the progeny will be polled, but if two of these hybrid polled animals are mated, the probabilities are that out of every 4 of the progeny there will be 1 pure polled, 2 hybrid-polled and 1 horned; and again ,if a pure red shorthorn is mated to a pure white shorthorn the progeny will be roan, and if roans be mated the progeny will likely be 1 red, 1 white and 2 roans. If a white polled animal is mated with a red horned animal the progeny will be roan polled, and if such roan polled animals are mated the probabilities are that only one pure bred polled animal will appear in sixteen of the progeny. In this case two characters are combined.

While color and horn characters are not the important characters in cattle breedinf, the fact that their behavior in breeding has been fairly well determined has encouraged investigators to determine the laws of hereditary for other more important characters such as the quality and quantity of milk. These characters, however, are more complex, for many things enter into milk production—capacity, temperament as well as the glands. It is likely, therefore, that the inheritance of milk production has to do with several factors. This difficulty may be made clearer when it is known that when only one pair of characters is concerned, as in the instances given above, the chances of getting the desired character in the second generation is one in four; the chance of getting a combination of two desired characters is one in sixteen; one of three characters, one in sixty-four; and of four characters one in twoy hundred and fifty-six. Another serious difficulty lies in the relatively small number of progeny possible from a single pair of cattle. If cattle bred like rabbits or fowls or plants the breeders could get results much more quickly. Still another difficulty lies in the invisibility of many of the characters that determine the real worth of a cow. Color, horns, and flesh are externally evident, but milk productivity is not. This is one reason why the show ring has hampered rather than helped to bring out the best dairy cows.

The Performance test must be made at every turn in developing a high producing strain.

The Mendelian laws of heredity furnish the only means of ascertaining the real worth of a cow and of indicating the germinal constitution of an individual produced by any long-continued system of inbreeding. They show the weakness of basing the real worth of a cow on pedigree alone, for in most cass matings have occurred which do not keep up the standard of excellence. More exceptional individuals may be expeceted in the progeny of average parents, but not even the majority of the descendants of

exceptional parents will be exceptional. In fact the progeny of the matings is always somewhat lower than the parent stock. In the best of strains, therefore, this "drag of the race" is so common that only the most vigorous testing and all the means at the disposal of the breeder will develop a pure strain of superior excellence.

The business of the true breeder is to strengthen th strong lines and to weaken the weak lines of countless ancestors. Only by mating sires that breed daughters and grand-daughters of superior milk productivity to the most productive dams, by inbreeding the first generation of hybrids, by making his selection of pure lines from the next generation, and by using the weigh scales and the Babcock tester will the breeder build up a pure strain that will breed true.

Mendel's laws reveal the fact that by long continued inbreeding the animals come to possess practically the same set of characters, that is, only one member of each pair of the entire set remains. They belong to one pure line.

If each of these members is desirable and free from weakness there is no inherent reason why inbreeding, even long continued, should be injurious.

If the vigor of the animals shows signs of deterioration, it can be restored by outbreeding, but great care must be taken to prevent the introduction of some of the original pairs of character.

KEEP THE CALVES GROWING STEADILY.

Plenty of the right kind of feed is necessary to produce large and vigorous dairy cows. Well-fed calves not only grow larger and mature earlier, but they seem to have some stamina and reserve energy for heavy milk production. A little extra feed of the right kind given the growing heifer returns a greater net profit on the investment than feed fed at any time later. If the calf runs down in flesh condition it requires heavy feeding to get it back. Calves fed so that they grow steadily, though not always rapidly, from birth to maturity develop into more profitable cows than those fed sort of spasmodically without regard to their daily requirements. There is no reason why the average dairy farmer can not raise as large and rofitable cows as any he can buy if he will but use a pure-bred sire and give his heifer calves proper care and plenty of feed. They must have a well-balanced ration if they make uniformly rapid gains, but what most of them need above everything else is enough palatable and nutritious roughage.

The heifer calf that is worth raising is worth giving a fair start in life. Nothing has yet been found that can successfully take the place of milk in feeding young calves. Whole milk for the first three weeks gives the calf a good start. After the third week skim milk may be gradually substituted, and some kind of grain feed or prepared calf meals added to take the place of the fats removed by the separator. Choice alfalfa or clover hay kept in small racks in the calf pens, also whole oats kept where they may have access to it at all times, will furnish the right kinds of bone, blood and muscle-building materials n proportions to produce rapid growth and uniform development. The amount of milk to feed will depend upon the available supply and the ability of the calf to take care of it. Skim milk should be fed in as liberal ameunts as practicable until the heifers are at least six months old. Some feeders claim that feeding whole oats is less conductive to rapid gains than feeding ground oats, but carefully conducted experiments indicate that equally rapid gains may be made by feeding whole grains, and that dangers from digestive troubles are minimized. After the calves reach the age when they will eat quite a bit of oats, it is preferable to feed them twice a day all the whole grain they will clean up readily and later, say at about six months, change to ground feed or the regular ration that is being fed to the cows.

Heifer calves eight months to a year old should be sufficiently well-grown that they will be able to make use of hay and fodder, so that the bulk of their ration may come from such feeds. Alfalfa, clover and mixed hay will furnish nutrients at as low a cost as any source, and such hay is splendidly adapted to stimulating growth in young dairy animals. It should be furnuished in as large amounts as the calves will consume. Silage is another splendid feed and may be supplied as liberally as it will be cleaned up. Calves at this age, however, will not consume large quantities of this succulent feed. Any other clean and wholesome roughage may be added to give variety and make the ration more economical.

There is a happy medium in this matter of feeding calves so that they will develop into large and profitable cows. The best heifers are not always those which are fed the most expensive rations. Also experience is proving that heifer calves moderately fed on suitable grain feeds along with an abundant supply of nurtitious roughages, develop into larger, healthier, stronger cows than those which are pampered or those which are forced by too heavy grain rations.

RINGWORM ON CATTLE.

Ringworm appears most often on animals kept in damp, close, filthy quarters. It is caused by a gungus which grows in the outer layers of the skin. The spores are very resistant.and will live a long time in infected quarters. They grow when conditions become favorable. The germs are spread from infected animals or quarters to healthy animals. Blankets, curry combs, fence posts or other objects against which the animals rub spread the disease.

Care should be taken to prevent contact between animals or infected objects. Thoroughly cleanse and disinfect as far as is possible everything with which the diseased animals have come in contact. The treatment consists in clipping the hair when necessary. The crusts are softened with green soap or ordinary soap and soft water. The diseased parts should then be painted with tincture of iodine, or salicylic acid and alcohol, one part to ten.

Be on hand when the mare foals but do not interfere unless assistance is necessary.

It Pays to Feed Empire Feeds!

Cattlemen, farmers and dairymen have learned that it is profitable to buy stock feeds by proteins and that the feed containing the proper amount of proteins is the feed that brings results.

Another consideration steps in, however, and that is, that beyond a certain point, protein ingredients may be present in too great quantity for the animal to use, and there is waste.

EMPIRE FEEDS are rightly balanced

Empire Dairy and Hog Feeds contain not less than 16% proteins (*guaranteed*), which will be used for the nourishment of the animal, without waste.

We aim to put up feeds that will pay the user. Only good sound grains and other ingredients are used, and certainly no filler or other useless stuff will ever enter into EMPIRE FEEDS. Try a quantity for a fair testing time. We will abide by the resulting **improvement in your stock.** Ask your dealer for the honest feeds—EMPIRE BRANDS.

THE HORSE

FEED COLTS WELL TO MAKE BIG HORSES.

Exercise is very necessary for the brood mare right up to foaling time, as it makes parturition more easy, and my belief is that a stronger foal is the result.

Immediately at birth take measures to prevent joint ill, the worst plague of foals, by using a disinfectant. A good treatment is to paint the navel with iodine to kill germs that may happen to be there, then dust with a drying powder daily for a few days. Watch the colt for constipation or diarrhoea. Give castor oil, one tablespoonful, also an injection of warm water, for constipation. Reduce the amount of milk the colt is getting and give it a dose of castor oil, which will remove the matter causing diarrhoea.

The mare and foal should run on pasture when the colt it two days old, and should be brought in at nights off the damp ground for at least two weeks. If the mare is not wanted for work, leave them on the pasture and feed, morning and night, a ration of grain and oats to the mare. At four weeks the colt will show signs of eating, and when brought in off pasture, should be given a box of its own to eat out of. Gradually increase the amount of feed until half a gallon of oats and bran is reached; also provide a little day.

A colt should not be weaned until four months old, and if it has been getting such feed as is mentioned here it will not be checked in its growth. Weaning should take two weeks at least and then turn him out on pasture with other colts if possible, but not with its mother, for sometimes they will let them suck, and it is very hard to break them of the habit.

Never stop feeding a colt, because that is what makes the horse. When cold weather comes put them in at nights in a roomy, well-bedded box stall. Some people never think of bedding but it is very important.

I disagree with people that advise tying colts up. They should not be tied until the second winter, even though a little harder to handle. Turn them out always if the weather is fit for exercise—nature's best medicine for growing colts. Give them plenty of clean, fresh water at least three times a day. Oat sheaves at noon, nay at five, and about one-half gallon of whole oats mixed with two handfuls of bran at night, with a big forkful of oat straw. In the morning feed them their ration of grain and some hay. C. W. M.

THE price of steel is high. At the same time a Pedlar steel roof, because of its lifelong durability, and the protection it gives from fire, lightning and every kind of weather, make it the cheapest roof you can buy. It costs you nothing to find the facts. Send us the dimensions of your buildings for free estimate.

WATCH FOR NAVEL ILL AND DIARRHOEA.

To those farmers who are in such a position that they do not require the services of their mares for summer work, little advice need be given, provided. of course, that the mares are in good condition at time of foaling, i.e., neither too fat nor too thin, and that good pasture and water are abundant. In any case, however, a liberal feed of oats to the mare, once or twice a day, to keep up her flesh and stimulate the milk flow, is an added advantage, even though not imperative. The majority of farmers, however, who have only a limited number of horses, and wish to derive the greatest amount of usefulness and profit from them, are obliged to work their brood mares. To my way of thinking, early in June is the ideal time for the average working mare to foal. The rush of seeding is past then, and we should be able to give the mare a few week's well-earned rest. The pasture is also at its best then, providing the best milk-producing ration for the mare, as well as providing roughage for the young, growing colt By all means, give the mare a few days' rest before foaling, and let her run at pasture; it makes an ideal place for the mare to foal in, and the green grass will act on her as a gentle laxative and put her internal organs in good condition for the coming ordeal. Assuming the colt to have been safely born—and it is good practice to be around at foaling time or soon after, in case of possible trouble—the first thing to do is to prevent infection of the navel. If at pasture, trouble is not liable to occur, but if in a stable, treatment is advisable The navel and surrounding parts may be painted with tincture of iodine, or if it is not available, with oil of tar or a solution of creolin (2 or 3 per cent.). Treatment to be effective should be continued till the navel cord is quite dried up. Secondly, watch for constipation or diarrhoea. If the bowels are not moved, say, before twenty-four hours, give a dose of castor oil, about two tablespoonfuls. The same amount of butter will do if castor oil is not available, and each should be accomplished by a warm water injection. For diarrhoea give the same dose of castor oil and reduce the quantity of milk received.

After a few week's rest the mare may be put to light work, the colt being kept in a box stall. Make a point of taking the mare to the colt in the middle of the forenoon and afternoon, whenever possible, for the first few weeks, being careful not to let the colt suck till the mare cools off. Provide an extra large oat box for the mare, and feed her a little extra; the colt will soon learn to feed with her, and her ration may be increased as the colt gets older. Unless absolutely necessary, do not wean the colt until winter sets in, and then wean him gradually. Feed the colt liberally with hay, with a little green sheaf, too, if you have it, and give him a fair amount of oats and bran—two parts of oats to one of bran. Let him suck only twice a day at first, then only once, and gradually accustom him to do without any at all. Liberal feeding of grain will do him no harm, as a colt will seldom eat too much, and if weaned in the above manner, his growth will not be checked very much.

With regard to exercise, let him have an hour or more outside every day, if the weather is not too severe. Inside, let him have the run of a large box stall. Watch carefully for any sign of lice, and treat them to a dose

of 5 per cent. creolin if they appear, and if at all possible, don't have him in a stable alone. Company helps to keep him both lively and interested, and if you have colts about his own age, by all means keep them together.

HOW TO GROOM THE TRACTOR—SOME DETAILS WORTH REMEMBERING.

Those who are disposed to give up the horse team for a tractor, and who think by doing so, they will lessen the daily chore of attending to horses, will do well to read the following from a tractor owner who says he spends about the same time taking care of his tractor evry day that he did in caring for his team of work horses. This farmer says:

"Keeping the tractor fit means constant care and attention on the part of the operator. Like a good horse, it should be handled and cared for by one man who can become familiar with it and know its needs.

"While it is an inanimate object, it still has indivduality and responds to intelligent treatment. Further, the operator should study the principles of its construction as much as opportunity will permit. If the purpose of each part of the tracor is understood, better judgment will be used in its care.

"The instruction book which comes with evry tractor represents the tractor maker's best judgment as to the care of the machine. It also enables the operator to become familiar with its construction and principles. Under no circumstances allow it to become misplaced or lost. The repair parts' list, which gives cuts, description and numbers of parts, is nearly always furnished with the instructions and this book, therefore, becomes indispensable in ordering new parts or repairs.

"The greatest foes of the tractor are friction and wear. The same is true of other machines but it is doubly true of the tractor, because of the heat in the cylinders which must be lubricated and on account of the heavy pressures wihch are occasioned by the explosions within the cylinder.

The Daily Overhaul.

"The lubricating properties of oil are destroyed by the heat within the cylinders so that the system of lubrication for these parts should have special attention. Frequent inspection of the suplpy is also necessary because the tractor, being a heavy duty machine, consumes much more oil than an automobile engine running at the same speed.

"The use of kerosene in the engine may also cause some difficulty with the lubricating system. While many engines burn kerosene economically, there are times, especially when the motor may not be hot, when liquid kerosene gets into the cylinders and cuts or thins the lubricating oil so that it does not have the same lobricating properties as fresh oil. For this reason, many manufacturers of kerosene burning engines recommend removing old oil from the crank case and replacing with fresh oil after periods of from twenty-five to sixty hours' work for the tractor.

"Go over your tractor once a day with rags and wipe off excess dirt and grease. This is not so necessary from the standpoint of appearance, though this operator takes pride in its apeparance. This daily cleaning is more valuable in bringing to the attention of the operator loose nuts and bolts, worn or overheated parts, parts bent or out of adjustment, and the like. Remember that the tractor represents probably equivalent to the value of two teams of horses and is, therefore, entitled to as much attention as two teams of horses would receive.

What Every Tractor Owner Should Know.

That your tanks contain fuel, oil and water.

That every part is properly lubricated.

That all bolts and nuts are tight.

When you have proper fuel, oil and spark adjustment.

When engine is overloaded or over speeded.

When engine is in good condition, i.e., no carbon deposits, loose rings or bearings.

When valves and ignition are properly set.

When the clutch, brake and governor are correctly set.

What kind of lubricant to use in each place.

When engine gives signs of distress, knocking, overheating, lose power, etc.

Things you should do every day:

Follow out oiling schedule as required for each day.

Make inspection for worn, heated or loose parts, nuts and bolts.

Clean tratcor with rag.

Drain radiator in cold weather.

Every week:

When using kerosene drain crank case, wash with kerosene and replace rfesh oil.

Make inspection of other parts of motor. Do not make adjustments unless it is clearly necessary and then with the greatest care.

Every year:

Thoroughly overhaul tractor; make renewals.

Order additional parts and supplies likely to be needed for the year.

Those attending to stock should remember that attention to details is very important if success is to be attained. The old proverb illustrates this:

"For want of a nail the shoe is lost,
For want of a shoe the horse is lost,
For want of a horse the rider is lost,
For want of the rider the battle is lost."

Just because of a little carelessness many a valuable animal is lost.

Use a fly repellent on the horses several times each day. Fighting flies is more wearisome than drawing the implements.

Assist the young foal to get the first milk of the dam; it is necessary to start the digestive system of the foal functioning properly.

See that the infoal mare get some grass; it is a gentle laxative and a good tonic for the digestive system.

Keep the collar and harness clean; it prevents many sores.

An Analysis of the "Road Speed" of a

MAXWELL

is a tribute to its special steels.

Men driving larger cars have often wondered at the "road speed" of a Maxwell.

True, in an open, straight stretch they have run away from a Maxwell.

But in any "piece of going" (and we have many such roads in Canada) in which hills, turns, curves or rough roads enter into the general average, they do not outrun a Maxwell.

The reason for this is the special steels in a Maxwell. They are made to Maxwell's own formulae, and make possible construction combining great strength with light weight.

The lightness of the weight enables a Maxwell to take a turn with more ease and less slowing up, come down a hill under better control, ascend a hill as well, and make more time over a rough piece of roadway.

The strength of its steels enables a Maxwell to stand equally as well, or better, side strains, road unevenness, etc.

In other words, a Maxwell makes speed when a larger car cannot, and thus evens up to a high average its "road speed" without breaking the speed laws.

This ability in a Maxwell is one of many that is winning new friendships daily. Nearly 400,000 of them to date; in another year 500,000.

POULTRY.

GIVE HENHOUSE A GOOD CLEANING.

When poultry houses were small and dark and the hens roosted on a step-ladder system of roosts, little attention was given to sanitation. The droppings were allowed to accumulate in heaps beneafh the roosts and there was little scratching place for the hens that was fit for the purpose. But afrmers have found two things that are true. Hens in clean houses keep in good health. And poultry manure is valuable as fertilizer. So it pays to keep the hen houses clean.

The dropping boards should be cleaned frequently enough to keep the house free from odors and prevent much dirt from accumulating. The manure should not be dumped just outside the poultry house, but stored where it will not be wasted or immediately spread on the fields or garden. Some poultrymen clean the boards every day, others do it about once every week. A great deal depends on the number of birds in the house and the time that can be devoted to their care.

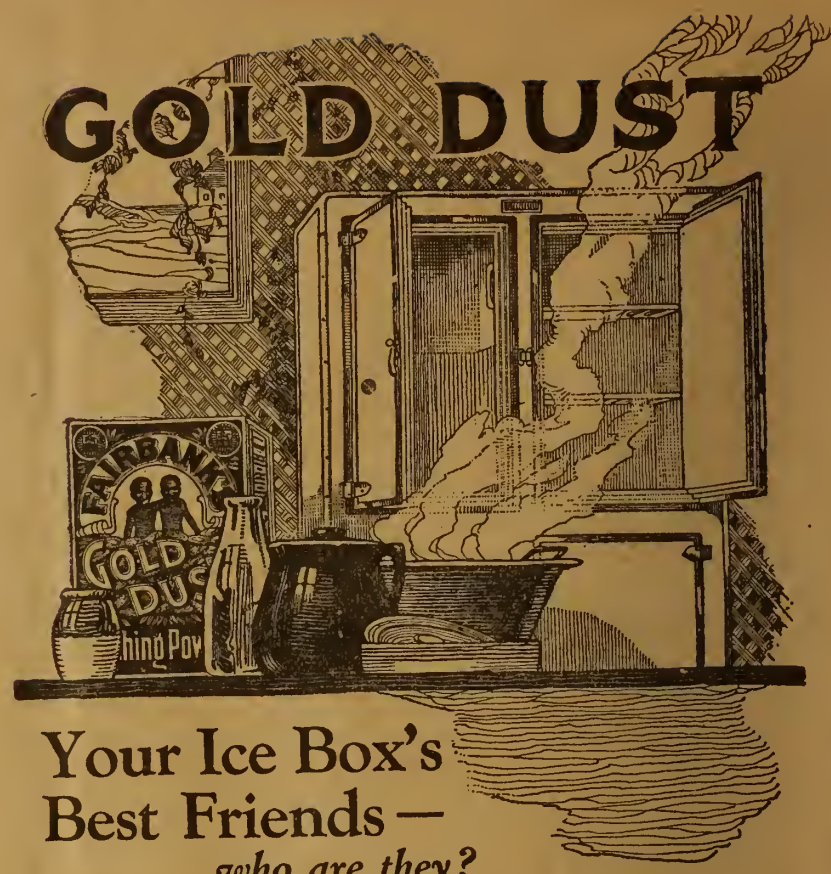
We find that the commercial coal-tar disinfectants which can be diluted with water are much cheaper than kerosene oil for spraying a poultry house. They give a clean odor to the house. Lime-sulphur is a good disinfectant and on fruit farms thers may be enough left in the power sprayer after one of the orchard applications to give the poultry house a thorough drenching. Lice paint on the roosts and in the nest boxes is a cheap method of keeping down lice and mites for a long period. The floor has a direct influence on the birds. If it is damp and dirty the air in the house will be unhealthful. When dirt floors are used it pays to shovel out the contaminated soil and replace it with several inches of clean sand. Do not continually be taking out dirty soil from the floor without replacing it or the level will soon be below the outside ground and this soon means a damp floor, and heavy rains may drain into the poultry house. Floors made of lumber or cement can be thoroughly swept and then washed with disinfectant.

To reduce the labor of keeping poultry houses clean all of the equipment must be portable. Nevt boxes that are nailed tight to the walls are an abomination. They form breeding places for mites and lice and the poultryman has no time to knock the interior of the hen house to pieces every time a thorough spraying is necessary. Build all the nests in portable sections of six or eight nests to a section. Then they can be picked up and carried out in the sunshine. After the litter is dumped out they can be sprayed and ried in the sun. This will destroy pests and keep the nests in condition so the hens will use them.

All the feed hoppers, and water stands can also be carried from the house. And when the poultryman is ready to fight the pests with the spray rod he has nothoing in the way. Then the four walls, the floor, the ceiling and the roosts and dropping boards can be given the kind of bath which makes them clean and sanitary. This treatment keeps pests from becoming established and makes poultry keeping so much easier and profitable that it is worth all the trouble. Ife we begin early to fight lice and mites, the sumer poultry work will not include fighting these pests that breed so fast during the hot wealther. R. G. K.

Keeping boys on farms is almost if not quite as important as agriculture itself, for if we cannot have plenty of manpower, coupled with trained minds, how can we expect to have a profitable agriculture?

Keep matches out of children's reach and never alow them to carry or handle them.



Your Ice Box's Best Friends—
who are they?

THE ice man is one. A tablespoonful of Gold Dust is another. Once a week your ice box needs a cleansing, refreshing Gold Dust bath—from "cellar to attic". THE RIGHT BIRDS FOR LAYING CONTESTS.

(Experimental Farms Note.)

Laying contests conducted this year show very clearly that the degree of maturity which the birds possessed before reaching the contests has very much to do with results and especially the results during the winter months. This fact has been stated several times, and additional proof is now available, which is given in order that those wishing to enter pens in the contests next November may be able to take advantage of the information.

Take the Prince Edward Island Egg Laying Contest—the production has been low, not as good as it was last year, but in looking over the report of the condition of the birds when they were received at the contest, the reason is quite apparent. The birds were not as mature this year as last and certainly not as mature as they should be if a good egg yield is to be expected.

Pens No. 1, 3, 10, 12 and 18 contained the best matured birds that were received. Pens 15 and 19 were not quite as well matured, but were in excelelnt condition and dveloped rapidly after arrival. Some of the other pens had well deveolped individuals in them but had too many immature birds while in many of the pens the birds were not fully grown when they arrived.

Seven pens that were fairly well matured and in good condition when they arrived averaged 9.5 eggs per bird for the two months ending December 31. The seven pens which arrived in an immature condition averaged 1.3 eggs per bird for the first two months. At the end of six months the younger girls, having then matured, gave an average for the six months of 24.2 eggs. While the well matured birds at the end of the six months gave an average of 46.9 eggs, or a relative gross revenue for eggs of $69.58 for the immature birds and $142.13 for the mature birds.

In some cases birds arrived at the contest past maturity, that is, they had started to lay before entering the contest, and the change brought on a moult and a consequent loss of time. This condition, however, was not quite so apaprent in the Prince Edward Island contest as in some of the other contests.

In order to make a good yearly revenue birds must lay during the period of high prices and if they do not start laying before the cold weather comes, as a rule, they will not start to lay for weeks and sometimes months afterwards.

Pen No. 2 did not lay an egg during the first four weeks of the contest and had only three birds laying at the end of the 8th week with a total production of 29 eggs. Pen No. 4 started laying during the fifth week and had only three birds laying at the end of the 8th week with a total production of 27 eggs. Pen No. 17 did not start until the 10th week thereby handicapping themselves by over two months when prices were high. The birds in ths pen iwere in condition when they arrived at the contest and after they received their growth have done exceptionally well. How much better would it have been if they had received their growth before entering the contest.

It must not be forgotten that development in birds does not mean production, but if birds are bread for egg production the bird that is fully developed has a decided advantage over her immature sister.

Birds intended for a laying competition should be in condition to lay just after they have reached the contest, neither before nor weeks after.

IT TAKES SO LITTLE.

It takes so little to make us glad, just a cheering clasp of a friendly hand, just a word from one who can understand; and we finish the task we long had planned and we lose the doubt and the fear we had—so little it takes to make us glad.

—Ida G. Morris.

"THE VILLAIN STILL PURSUED HER."

"She looks as though she'd like to bite nails," laughed Dick Harmon, "but if they aren't convenient, you'd do instead."

"Yet she has just oodles of money," Evelyn Darcy replied.

At which there was a sudden pause in their bright, young chatter and a sudden pained look on Dick's smiling face. For the wistful way Evelyn said "oodles of money," her wistful sighs, cut deep.

When Dick and "the dearest girl in the world" had become engaged on the shining day of his graduation at the head of his class at the medical college, the young doctor was sure he could build up a fine practice in no time. but eighteen weary months of waiting had dragged by, and it was all he could do to make both ends meet for one, let alone attempting to finance an expensive day dream of marrying a wife and setting up housekeeping.

"It's funny how the villain still pursues" said Evelyn with forced gayety, in a quick effort to heal the wound she had given. "Ever since we first met Mrs. Rutherford at the Theliers' little dinner we're constantly running into each other."

"Perhaps the afct that she lives

"Perhaps the fact that she lives makes frequent visits to the tailoring establishment opposite my office has something to do with it," remarked Dick, also forcing gayety of tone.

Then the two young people changed the subject, and the rich Mrs. Routherford, who had bowed to them from the passing automobile, drifted out of their thoughts.

But that same evening Dick made an excited appearance at the Darcys'. "Guess what?" he began. "The villain again! A professional visit at my office this time. Gee! isn't it great?" he went on boyishly. "You know how the smart set follow like sheep. Let the rich Msr. Rutherford speak enthusiastically of 'that clever young doctor, Richard Harmon, I'm having now,' and Dickie's name and fortune will be made! Three cheers for the old girl, naily expression and all!"

"But what is the nature of her complaint?" asked Evelyn, equally excited. "She looks the picture of health."

"I don't know yet," answered the young medico very solemnly, "but I'm going into the case most carefully and thoroughly.

He went into it so carefully and thoroughly as to leave no doubt in his mind as to the truth—that there was absolutely nothing the matter with this most desirable of patients.

Poor, young Dr. Dick! To suppose he was owner of a gold mine and to have the vein peter out at the vrst stroke of the pickaxe! But many a promoter has made a fortune out of a worthless mine. Why shouldn't he promote the rich Mrs. Rutherford's imaginary ailments?

It was the old temptation that has so often come to a young physician both in life and in fiction.

For three days and three wakeful nights Dick Harmon wrestled with the powers of darkness. On the fourth day he reached his decision. If he had only himself to consider it might be different. But when Evelyn's happines depended on his making good he had no right to let a mere quible of conscience stand in the way.

That afternoon Mrs. Rutherford came in by appointment to hear his verdict. Intentionally he was half an hour late. But he dashed in, breathless with haste and apologies for his unavoidable delay. He excused himself a moment while he found out if there had been any calls in his absnce that necessitated his telephoning.

"It's only anticipating what will really be happening soon," he twinkled to himself as he returned to his consulting room.

"Now I am ready for you," he announced, all smiles and obsequiousness.

"In the last five years I've had many doctors," Mrs. Rutherford deeply sighed, "and, although they have all promised wonders and kept me running to their offices, I am still the same sad sufferer."

He listened with deferential attention and a profoundly wise look saying plainer than words that, considering the serious and bagling nature of her case, the failure of other medical men to get to the root of the trouble was exactly what might have been expected.

"Every one of them," she went on snappingly, "made a different diagnosis, and I suppose your diagnosis will be different again."

The young doctor was silent an instant. Then he cleared his throat. "Yes," he said, "my diagnosis will be quite different' I am sure. I have made a most thorough study of your case, Mrs. Rutherford, and I find absolutely nothing the matter with you."

She stared at him dumfounded, yet her astonishment was nothing compared with the surprise his words had given himself for when i came to the aprting of the ways the white habit of integrity of his whole nature had made it impossible for Dick Harmon to be false to his best self. He made a joke of it all when he told Evelyn. "The villain still pursues," he laughed, "but now we do not speak when we pass by. Mrs. Ruotherford was sitting at her window as I came here, and such a glassy stare as she game me!"

The days went past without special incident until three weeks had piled themselves up. Then, unexpectedly, the monotony was broken by an emergency call. An accident had occurred in the next block, a motorcycle having run into an automobile, and its injured occupant carried into the corner drug store.

The young doctor's professional calm showed no sign, but when a few minutes later he bent over the unconscious victim, rendering quick, effective first aid, the blood in his veins gave a sudden leap. The white-faced, prostrate woman laid low on the couch in the drug store's back room was no other than Mrs. Rutherford.

She regained consciousness while he was taking her home in the ambulance and gave the young doctor bending solicitously over her a naily look, but did not speak.

He sent for a leading surgeon, consented to stay to administer the anaesthetic during the examination of injuries and the setting of three broken bones, and then dismissed himself.

And the whole incident ended in a sprightly account of it that evening to Evelyn. At least, so the young doctor thought, but to his surprise the next day he received a peremptory summons to the injured woman's bedside.

"What do you mean by neglecting one of your patients in this scandalous manner?" she asked as he entered the sickroom.

"But I did not consider you one of my patients," said Dick Harmon gently. "I was merely called in for the emergency and supposed, of course, you would prefer your own doctor to attend you."

"I have no 'own' doctor," she snapped. "I've been too ridiculously healthy to require one."

"But the five doctors you told me about?" he gasped.

"All myths; made up out of my own head, like my ailments. I knew there was nothing the matter with me when I went to your office."

"Then why did you come?" again gasped the young doctor.

"Just to be neighborly. Young physicians sometimes need a little—encouragement, you know."

Dick Harmon stared.

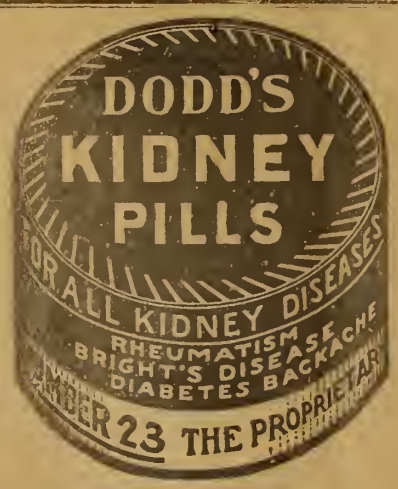
"Oh, you needn't flatter yourself," she went on in her sharp way. "It wasn't on wour account I came. I did it for Evelyn."

"For Evelyn?" he repeated, more astounded than ever.

"Yes. From the first time I met her she went straight to my heart. She reminded me so much of a young girl I once knew—a girl engaged to a young doctor for years. She got tired waiting at last and married another man—for money—and lived unhappily ever after."

The naily look hardened on her face as she spoke the last words, but the young doctor's eyes—which had seen down deep into sacred hidden places—were full of infinite pity.

"Well," demanded Mrs. Rutherford sharply, "now that I have something the matter with me, do you intend to take my case or not?"



ROYAL YEAST CAKES

are now packed in square packages. Each package contains five cakes, which are equal in quantity to six round cakes. All dealers are authorized to guarantee that the quality of the round and square cakes are identical in every respect.

WHY MY FRUIT KEEPS—SUCCESSFUL CANNING METHODS OF ONE PRIZE-WINNING WOMAN.

(By Mrs. Ernest Norman.)

A few housewives still retain the old method of putting up fruit in the form of jam or preserves to insure its safe keeping. The addition of much sugar to fruit is not at all desirable, as it destroys the fresh and natural flavor and makes it harder to digest. The acids which fruit contins and which are real tonics to the body lose their good effect, so that in the case of most fruits it is best to can them with as little sugar as will make them palatable.

What is sterilization? Sterilization means to destroy completely all germs or bacteria and their spores in and about any object. Germs that cause decay may be divided into three classes, namely: bacteria, yeasts or ferments and molds. These germs multiply very quickly and in time cause foods to spoil. Bacteria are much harder to kill than molds or ferments and attack such foods as meats, milk and vegetables, but rarely fruits.

All fruits contain yeasts or ferments. These are destroyed by exposing them to a temperature of 212 degres Fahrenheit, or the boiling point. Therefore in the canning of fruit, to insure perfect sterilization means that the fruit and all utensils used in canning must be kept at a boiling temperature until the fruit is properly sealed. The rubber rings should be soft in order to insure proper sealing. It is more economical to buy new ubber rings every year than to risk spoiling several jars of fruit by using old rings.

When the fruit is cooked in the jars and properly sterilized practically all the air will be driven out of the jars by the steam. Upon cooling, this steam is condensed, a vacuum is thus

The Best Washer You Ever Met!
Never gets tired or cross! Never "skimps." Handles light or heavy goods—blankets table cloths, or handkerchiefs—a full tub or a few articles equally well. Doesn't wear or tear the most delicate fabrics, and only takes half the time! Isn't that the kind of a washer to have in your home? Then go to your dealer's to-day and meet the—
Maxwell
"Home" Washer
—a ball-bearing washer—light, noiseless, easy-running—of handsomely-finished cypress. Specially-designed dasher makes it best for washing everything. Enclosed gears mean safety. Write us for booklet—FREE.
MAXWELLS LIMITED, Dept. X St. Marys, Ont. 35

That Racking Persistent Cough

Should Never Be Neglected.

The constant hacking, racking, persistent cough that sticks to you in spite of everything you have done to get rid of it, means danger.

The longer the cough sticks, the more serious menace it becomes to your health.

It is a very easy matter to get rid of the cold at the outset by using

Dr. Wood's

Norway Pine Syrup.

In nearly every case it will allay the inflammation, soothe the irritation, heal the diseased mucous lining of the lungs and bronchial tubes, and thus rid the system of all the bad effects of the lingering cough or cold.

Dr. Wood's Norway Pine Syrup has been universally used for the past 30 years, and so great has been its success, it is only natural that a great many imitations have been placed on the market.

Don't accept any of these, so-called Pine Syrups. Get the original "Dr. Wood's."

Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

formed inside the jar, and this draws down the glass top against the rubber rings and seals the jar automatically. Be sure that the edge of the glass cover that rests on the rubber has no nicks in the edge, as in that case it will not seal properly. Never turn a jar upside down before it is cool, as this will prevent its sealing.

Choose a jar of strong glass, with wide mouth and straight sides. The kind having solid tops, either of glass with wire spring or of lacquered tin with a clamp fitting over the top, is the most satisfactory. Jars with porcelain-lined covers are undesirable and make sterilization difficult.

Getting Ready.

See that the jars are carefully cleaned and scalded after being emptied of their contents, especially if the contents were moldy. This will save time and labor when the rush of the canning season is on. Never pour boiling water over a glass jar, but plunge it quickly into hot water deep enough to cover it, and let it remain there long enough to sterilize.

For sterilizing and cooking the fruit a washboiler may be used, but the writer prefers using tall tin pails or kettles, with tight covers, each holding three or four jars, as there is less danger of burning the hands by steam when lifting out the jars. Moreover the fruit is cooked in a better condition, as only a few jars are prepared at one time. A jar lifter saves many burns and costs only twenty-five cents. A strawberry huller and cherry pitter also save time. A fruit pricker can easily be made by inserting several coarse needls into a broad cork.

Th fruit for canning must be fresh, sound and just ripe, or a little underripe. Use a silver knife for paring pears and peaches. To peel peaches quickly place a few in a wire basket, immerse in boiling water for two or three minutes, then plunge the basket into cold water for a moment, then peel. Cut in halves and remove the stones. Two or three stones in a jar improve the flavor. Pack the jars with fruit and when full fill to the top with hot sirup to prevent discoloring. Wash all large fruits before paring. Soft pears, like the Bartlett, may be cooked in jars, but hard pears and quinces must be cooked in water first before the sugar is added.

When ready to work put the rubbers and the glass covers in a dish of hot water on the stove to sterilize. Lacquered tin covers need only to be dipped into boiling water before being placed on the jar. Prepare the sirup and then stand it on the back of the stove to keep warm while the fruit is being prepared. Put the raw fruit into the jars as tightly as is possible without crushing it. In the case of berries knock the jar gently several times on the table to pack the fruit. Then stand it in a dish of warm water, about two inches deep, and pour the hot sirup very slowly over the fruit. Fill the jar just to the brim. Leave the cover loose till the fruit is cooked in order to allow the steam to escape and to prevent the jar from cracking. If jars with tin tops are used, having a removable clamp over the top, this clamp may be left on, as it acts as a valve and allows steam to escape. Place the jars in a pail or wash boiler, until it reaches the shoulder of the jars; cover the boiler tightly and bring the water to the poiling point. Allow fruit to cook until it begins to rise from the bottom of the jar, the length of time depending on he kind and ripeness of the fruit. Plums should be pricked with a pricker and cooked in jars till the skin begins to crack slightly.

One Sirup for All.

When the fruit has boiled sufficiently the covers must be tightened before the jars are taken from the hot water. Then lift the jar and place it on a dry board away from any drafts in order to prevent cracking. When the jars are cold turn them upside down and on their sides, changing the position several times in order to allow the juice to penetrate all the fruit evenly. In a few days examine the jars. If the fruit is still near the top of the jar it is keeping, but if it is down at the bottom open the jar and use.

To make the sirup for canning add four cupfuls of boiling water to six cupfuls of granulated sugar. This amount will fill about four quart jars of raspberries or other closely packed fruit, or three quart jars of halved pears, peaches, or cherries, or two quart jars of large whole fruit, such as large plums. Heat the sugar and water slowly and allow it to boil very gently without stirring for five or seven minutes, skimming all black scum from the top. Do not allow the sirup to boil hard or do not stir it after the sugar is dissolved.

Now here is where the simplicity of my method comes in: With only a few exceptions I use the same strength of sirup for all fruits. The amount of sirup added to each jar adjusts itself according to whether the fruit packs closely or loosely in the jar. It so happens that the sweeter fruits, such as berries, can be packed very closely and will require only about a cupful of sirup to the quart, while the acid fruits, which are large and pack loosely, require from one and a half to two cupfuls of sirup to the quart.

HOW TO FIGHT POULTRY VERMIN

On the advent of warm weather it pays to begin warfare against lice and mites among poultry, otherwise they will get a flying start towards multiplying. If, during the first few warm, bright days the hen house is given a thorough sweeping and cleaning and some disinfectant like a good coal tar preparation used, it will remain sweet and clean for a month or more providing the droppings are removed daily and plenty of fresh air can get through the house.

It is between the nest boxes and the walls of the poultry house, under the roots and various other cracks all over the poultry house that the mites and lice do their breeding. These places must be especially watched, and frequently drenched with coal oil or liquid lice killer.

I have seen hens sitting on a nest, either to lay or to hatch, where the mites were so thick that thy covered the eggs like so much coarse dust. No wonder sitting hens desert their nests under such conditions, and laying hens prefer to drop their eggs on the floor rather than sit in the infested nests.

It pays to clean out all the nests every month, and scatter air-slaked lime in the bottom of them, as well as spray the box with a good disinfectant or lice killer. Roosts and dropping boards should also receive careful attention. R. S.

PUTTING UP THE FRUITS IN SEASON.

The following recipes have been tested and are reliable for preserving and canning seasonable fruits. Ways of spicin, fruit, making jam, and vinegar are also given:

Raspberry Preserves.

Select the largest berries, and use equal weights of berries and sugar, lay the fruit in deep dishes and sprinkle half the sugar over them in fine powder; shake the dish so that the sugar may touch the under part of the fruit. The next day make a syrup with the remainder of the sugar and juice drawn from the berries carefully, and let them simmer nearly an hour. Put them carefully in glass jars, and fill up with the sirup. There will be more than enough to fill the jars, but after standing over night the jars will hold more.

Pickled Raspberries.

Prepare a sirup of 2 pints of vinegar, 4 lbs. sugar, and ½ oz. each of cinnamon and clover; bring it to a boil, put in 10 lbs. berries, simmer for ¼ hour, and put into jars.

WILSON'S FLY PADS

Kill them all, and the germs too. 10c a packet at Druggists, Grocers and General Stores.

Canning Currants.

Use ¾ lb. sugar to 1 lb. fruit; let the fruit stand 2 or 3 hours covered with the sugar in the preserving kettle; then bring slowly to the boiling point, fill into jars and seal. Raspberries are nice put up with currant juice; allow 1 cup currant juice and 1 cup sugar to each quart of raspberries; add the juice and sugar to the berries, bring to the boil, and put in jars. Red raspberries and red currants are very nice canned together half and half.

Red Currant Jam.

Pick over the currants carefully, and allow ¾ lb. sugar to each pound fruit; let them simmer in the boiler until soft; then set aside until next morning, and cook them gently in a porcelain kettle 25 minutes. Then put into glasses.

Red Currant Jelly.

Choose good, ripe currants; pick them over, but do not stem them; wash, drain and mash them in a porcelain kettle; it will darken the jelly to heat them now; use a wooden masher; drain over night in a jelly bag, but do not squeeze it. Use 1 pint sugar to 1 pint juice; boil and finish as directed for other jellies. After putting in the hot sugar, let it boil till it thickens when exposed to the air on the spoon (which will be in 3 to 5 minutes), and then put it into the glasses immediately.

A Cough Won't Last Long

After You Start on a Bottle of

OLIVEINE EMULSION

The Great Health Restorer

You will get rid of the cough and get back your health and vigor just as quickly as did Mrs. J. A. Stonehouse, of Williamsdale East, N.S. who wrote:

"I took a bottle of OLIVEINE EMULSION last spring when I was in a weak condition and had a nasty cough. My cough left me and I also regained my health and strength."

This favorite home remedy is pleasant to take, agrees with the weakest stomach and is suited to every member of the family, young and old.

She Says He Can Now Do Her Work

MRS. M. MAGNANT GIVES THE CREDIT TO DODD'S KIDNEY PILLS.

Her back Ached and She Was Always Tired, But She States She Found the Relief She Longed For in Dodd's Kidney Pills.

St. Lina, Alta., July 18—(Special)—"Thanks to Dodd's Kidney Pills I can now do my work." So says Mrs. M. Magnant, a well known and highly respected resident of this place. Mrs. Magnant was a sufferer from that terrible wearines so many women know.

"My back ached," she says, "and I felt so tired all the time." But she used Dodd's Kidney Pills. She persevered with them, taking sixteen boxes in all, with the result given in the glad words of the opening paragraph.

Other women in all parts of Canada make the same statement. They were weighed down with weariness, weakness and pain, and found the relief they longed for in Dodd's Kidney Pills. For sick kidneys are the cause of the great majority of the ills fhom which women suffer. To treat them the kidneys must be strengthened so they will strain all the impurities out of the blood.

Ask your neighbors if Dodd's Kidney Pills do not help sick kidneys.

Fainting, Dizzy Spells

Weakness and Shortness of Breath.

Those feelings of faintness, those dizzy spells and "all gone" sinking sensations which come on from time to time indicate a weakened condition of the heart and disordered state of the nerves.

Milburn's Heart and Nerve Pills have no equal for strengthening the heart and invigorating the nerves.

Mrs. C. A. S. Drake, Paris, Ont., writes:—"I have used on towards the second box of Milburn's Heart and Nerve Pills and find they have done me good. I had those fainting, dizzy spells once in a while, and also weakness and shortness of breath, and would become so choked up at times I could hardly sleep without sitting up in bed. When walking too fast I would have to stop and try to catch my breath. I feel a lot better since I have used your pills and know that they have helped me wonderfully as I have improved very much."

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MINARD'S "KING OF PAIN" LINIMENT

The old reliable remedy for rheumatism, neuralgia, sore throat and sprains.

Best Liniment Made

MR. A. E. LAUNDRY, EDMONTON, writes:—"I fell from a building and received what the doctor called a very bad sprained ankle, and told me I must not walk on it for three weeks. I got MINARD'S LINIMENT and in six days I was out to work again. I think it the best Liniment made."

Minard's Liniment always gives satisfaction. For any ache or pain. It gives instant relief.

Minard's Liniment Co., Limited

Yarmouth, - - N.S.

A STRAWBERRY SUCCESS IN NOVA SCOTIA.

(Continued from page 776)

this in turn retards the blossoming which lessens the danger from frost.

Marketing.

Most of the picking is done by school children. They are paid by the box—formerly a cent and a half a fox but of late years two cents a box. No boxes are sent to market as the picker leaves them. The berries are settled down in each box and every box is filled as full as possible. This means satisfied customers and repeat orders.

Two crops are taken off each planting. The second crop is harder to pick and is always lighter than the first. It is found that it usually pays to take off a second crop as it spreads the main charges of planting and cultivation over two seasons instead of one.

The yield ranges from three to six thousand boxes per year. Four thousand boxes would be an average yield. Last year the price averaged seventeen cents a box sold to stores, ice cream parlors, etc. This means a cash return of over six hundred dollars per acre.

As the berries are carried twenty-two miles by horse and wagon, marketing charges are higher than usual. No clase records of the cost of growing have been kept. But it has been estimated at about four hundred dollars, made up as follows: Rent of land $10.00; preparation of soil $10.00; fertilizers and manure $50.00; plants $10.00; planting $20.00; cultivation $30.00; mulching $25.00; picking $100.00; crates $40.00 and marketing $100.00.

Home grown plants are used and charged only at what it costs to dig them. Only fresh clean boxes are used and each crate is stamped with the grower's name, number of boxes, quality, etc.

The above figures show that an average year will show a net of from $200.00 to $300.00 per acre. The amount of land planted to strawberries each year varies with the needs of the tarm. But no matter how heavy a crop there is, the demand always exceeds the supply. As soon as the first load of berries are due in Sydney several of the leading grocers insert advertisements in the local papers to the effect that thy will have "Huntington's strawberries." He knows that he is getting the best obtainable. This means repeat orders and good business for the grower.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers

BOX 309 WINDSOR, Ontario

PROFIT FROM POTATOES.

By G. E. SANDERS
Dominion Entomological Laboratory,
Annapolis Royal, N. S.

In view of recent investigations into the conditions of potato districts competing with the Maritime Provinces, it would appear that spraying potatoes will this year be more profitable than usual. Those who have potatoes planted are fortunate and now that they have spent from $100 to $150 per acre that will without spraying turn 150 bushels of potatoes, they should consider investing another $20 in labor and material to spray five times and thus insure from 100 to 200 more bushels of potatoes and also make certain that the whole crop will be sound.

The spray calendar for potatoes is:

First spray when plants are six inches high, 4-4-40 Bordeaux and 1½ lbs. arsenate of lime to 40 gallons.

Second spray, 12 to 14 days later 6-6-30 Bordeaux and 1½ lbs. arsenate of lime to 40 gallons.

Third, fourth and fifth sprays two weeks apart and of the same material as the second spray. If bugs are not present the poison may be omitted.

Apply at least 60 gallons per acre and better make it 100 gallons per acre.

Thorough spraying costs only $20, for five applications and will give a greater increase in yield than a half ton grade fertilizer. No one would think of planting potatoes without fertilizer or manure, yet the spray only costs one-half as much and will give a greater increase, yet it is often neglected.

The indications are that spraying will be particularly profitabl in 1920, so every grower is urged to spray thoroughly.

SPRAY CALENDAR FOR POTATOES

By G. E. SANDERS
Annapols Royal, N. S.

When the plants are six inches high spray with poisoned Bordeaux and repeat every ten days or two weeks until the tops die of old age or frost.

For the first spray use poisoned 4-4-40 Bordeaux and for the second and later sprays, poisoned 6-6-40 Bordeaux.

To make 4-4-40 Bordeaux, dissolve 4 lbs. of bluestone in 4 gallons of water, hanging the bluestone in a coarse sack at the top of the water, 24 hours before using. Dilute the four gallons of bluestone stock solution up to twenty gallons. In another container slake four pounds of stone lime or wet up for pounds of hydrated lime, dilute this up to twenty gallons.

Either put the lime solution into the spray tank first or pour the two solutions in together or pour them in by alternate buckets. Strain all solution going into a potato sprayer. If arsenate of lime, lead arsenate or

McINTYRE BROS.

SUSSEX CORNER, - - N. B.

GUERNSEYS!

For Sale—Registered stock. Male or female.

T. D. BLAIKIE,
Great Village, N. S.

Paris Green are to be added, add them last. For a 6-6-40 Bordeaux, use 6 lbs. of bluestone and 6 of lime.

In 40 gallons of Bordeaux use any one of the following poisons: Arsenate of lime, 1½ lbs. to 40 gallons; arsenate of lead dry, 2 lbs. to 40 gallons; Paris Green, 1 lb. to 40 gallons; arsenate of zinc, 1¼ lbs. to 40 gallons.

Aresnate of soda (arsenoid or solarsato) may be used at the rate of 1 lb. to 40 gallons; this poison must be combined with Bordeaux. Directions for using white arsenic may be obtained from the writer.

Use from 60 to 80 gallons per acre per application. Where a man applies only 30 to 40 gallons per acre, he cannot expect to control insects and diseases with the above formula. Some double them and get fair results, but there is always the danger of burning and poor distribution over the plant. Spray thoroughly and often if the weather is rainy or foggy.

PREPARING BEES FOR WINTER.

(Experimental Farms Note.)

The successful wintering of bees is often ascribed to luck. But investigations carried on at the Central Experimental Farm, Ottawa, during the past eight years, show that there is very little ground for this view. Of 348 colonies wintered during this period, both in the cellar and outo-f-doors, only seven per cent were lost, and this loss was ascertained in nearly every case to be due to definite causes, the principal causes being unwholesome and granulated stores and starvation. Most of the colonies lost from unwholesome stores did not die outright but became so weak that they had to be united to others.

The secret of success in wintering bees lies in their proper preparation. This prparation needs to be begun in July when it is important to see that the colony contains a good, fertile queen, preferably one raised the same year, which will raise a large number of young bees in the late summer months.

Each colony needs about 40 pounds of wholesome stores for the winter and early spring, and this should be in the hive before the end of September in most places. Clover honey and syrup made from refined (not brown) shugar are wholesome. This year, owing to the high cost of refined sugar, it may be hard to provide sufficient good stores, especially in some parts of Ontario and Quebec where the clover was killed last winter, and chances may have to be taken with honey that the bees gather from other plants. Buckwheat honey is wholesome, but some of the ohneys, for example, that come from wild plants in the fall, are inclined to cause dysentery and death.

Winter production is very important. If the bees are to remain outside, no better protection can be given than the 4-ocolony case made large enough to hold about four inches of packing consisting of shavings, or dried leaves a year or more old, around the sides and beneath the hives, and double this thickness on top. The apiary must be well protected from wind.

If cellar intering is followed, the bee cellar should be comparatively dry and it should be well insulated to prevent much variation in temperature. For a few colonies in a cold locality a boarded-off portion of the basement of the beekeeper's residence makes a good bee cellar and a furnace in ths basement is an advantage. If the stores are wholesome and the bees have been brought in before severe wather, the best temperature for the bee cellar is between 45 and 50 degrees F. If, however, dysentery has dveloped, the higher temperature will cause restlessness and a few degrees lower will be advisable.

F. W. L. Sladen, Apiarist.

Have a pit in your packyard as far removed as possible from buildings or fences in which ashes must be deposited.

Why hens go on a strike!

The feed elements that make *whites* of eggs are entirely different from those that make *yolks*. When hens aren't fed both the *white* and *yolk* making elements, they *can't lay*.

Missouri Experiment Station tests prove that 100 lbs. of wheat, corn, oats, barley and kaffir corn make (above bodily maintenance) an average of 224 yolks to 154 whites. Based on data from the same experiments, Purina formulas produce, (above bodily maintenance), as follows:

Purina Scratch Feed	247.49 yolks	142.11 whites
Purina Chicken Chowder	182.05 yolks	282.55 whites
Combined Ration	429.54 yolks	424.66 whites

These Purina feeds not only make a practically *equal* number of whites and yolks but *more* of both than ordinary feeds.

Note that Purina Chicken Chowder contains the necessary white-forming elements to balance up the yolk-making grain ration. That's why it makes hens lay so heavily. Instead of the yolks being absorbed by the hen's system, Purina Chicken Chowder makes the whites to *complete* the eggs and they are laid. Thus we can absolutely guarantee

more eggs or money back

on Purina Chicken Chowder if fed with Purina Scratch Feed as directed. You take no risk.

BUTTER FAT CONTENT; AND HOW IT VARIES.

The butterfat content in milk may vary considerably from day to day, especially with cows which are producing a maximum flow, and also with the different milkings during the day. Usually a high test follows a short milking period. That is, milking there times per day, for example, so that the period between the morning and noon milking is shorter than the other two, the noon test will usually be higher than the other two. It often happens that the morning test is the lowest of the day. There seems to be little correlation between the amount of milk produced and teh percentage of butterfat. Oftentimes an increased milk flow will be accompanied by an increased fat percentage.

The wild cucumber vine is one of the most rapid growing annual vines that may be used for a trellis or to cover up unsightly places.

Shubenacadie, - - Nova Scotia
Successor to J. MacDonald & Son

ELMHURST STOCK FARM

Clydesdale Horses, Hereford Cattle, Leicester Sheep.

We are offering 4 Bulls fit for service, 9 to 12 mos. old. They are good thick, straight bulls fit to head a herd in any county. Prices moderate. We have Rams and Ewes for fall delivery. Write your wants, we can suit you in quality and prices.

William O'Brien & Sons, Windsor, N.S.

Firshade Farm

Dual Purpose Shorthorns

P. R. L. FAIRWEATHER
Rothesay, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter In 365 days, 1280 lbs.

Phone or write.

SOME MEAT.

A quarter of a million carcasses of dressed lambs, weighing 7,000,000 pounds, constituting the largest amount of meat ever shipped from Australia in a single vessel, were landed at Boston recently by the British steamer Armagh. Some idea of the immensity of the shipmetn may be had from the fact that the lambs, if placed in columns five abreast, wohld make a flock extending a distance of 40 miles. The Armagh also had 17,103 bales of wool, 2,236 dry hides and 58 masks of pelts. The cargo was worth close to $8,000,000.

President and Manager.
The Man Behind the Guarantee.

What a few of our Customers wrote us last year:

Wallace Machine Works Limited,
Sussex, N. B.

Jeffries Corner, Kings Co., N. B.
Jan. 30th. '20.

Gentlemen:—

As you know, last fall I purchased one of your No. 2 Little Giant Threshers and it gives me much pleasure to tell you we have had excellent satisfaction. We found the machine all and more than you claim it to be. Most of our barns being small, we had considerable moving to do over a rough country, we had no trouble whatever to thresh and clean sixty bushels and more of oats per hour. I had such good luck with your machine that my brother decided to buy one and I know that he has had the same satisfaction that I have had. I have nothing but the highest praise for the Sussex Little Giant and would recommend them strongly to anybody thinking of purchasing a machine.

Wishing you every success, I remain,
Yours truly,
MURRAY VIRTUE.

Apohaqui, N. B., Oct. 1st, '19.

Wallace Machine Works Limited,
Sussex, N. B.

Gentlemen:—I purchased one of your No. 2 Threshers this year and I must say it is giving me excellent satisfaction. Only last Saturday I threshed at Wm. McLaughlin's, Parlee Sett. 431 bushels of grain of which was 212 bushel of Buckwheat, 26 bushel of barley, and 193 bushel of Oats, from 7.30 in the morning until 5 in the afternoon allowing one hour for dinner, and as we only had bags enough to hold 80 bushels we had to stop after threshing this amount each time and empty.

I did this without hurting my machine in the least and cleaning the grain in good shape.

Wishing you every success, I remain,
Very truly yours,
JOHN ARMSTRONG.

Hebron, N. B., Dec. 26th, '19.

Wallace Machine Works Limited,
Sussex, N. B.

Gentlemen:—

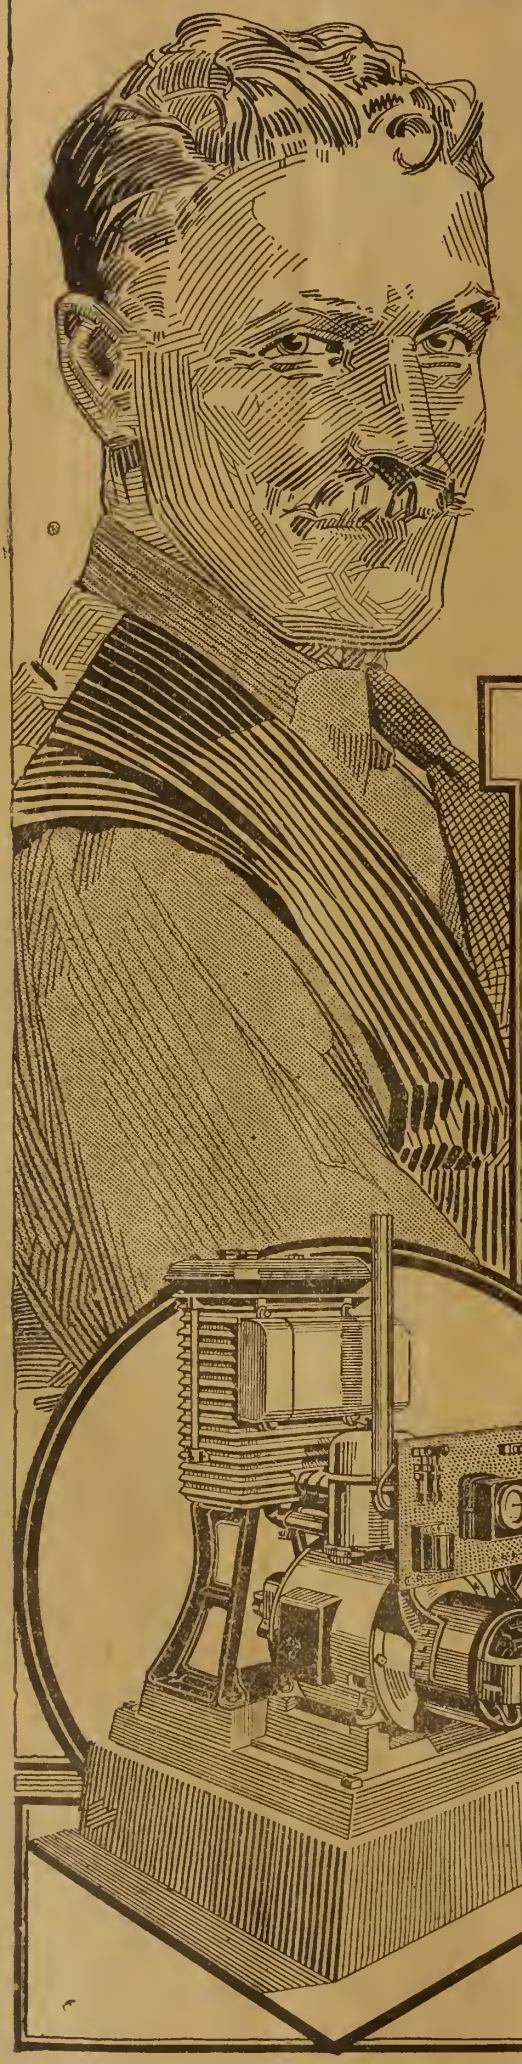
The two horse power thresher I bought from you this fall is a dandy, the best we have ever used. Have threshed one hundred bushels in one hundred minutes. Every one we threshed for said they never had such good satisfaction. There are several machines around here but I guess they will all have to take a back seat next fall.

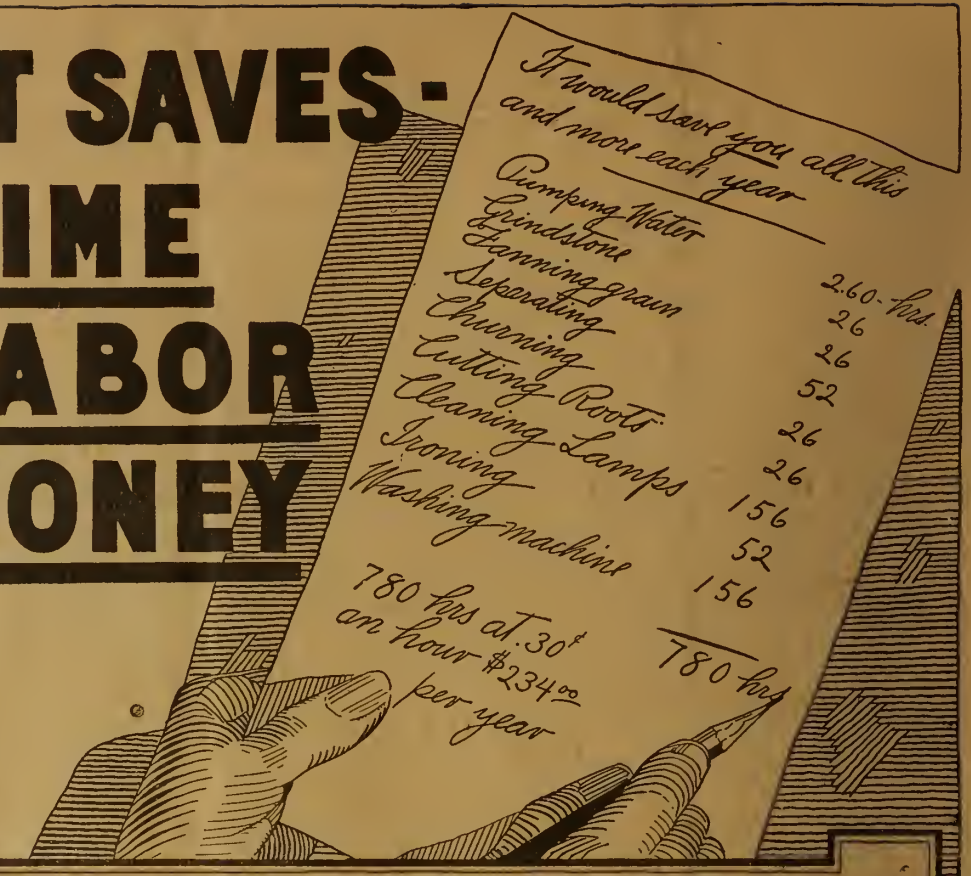
Wishing you Success and a Happy New Year, I remain
Yours truly,
KINNEAR HOAR.

WALLACE MACHINE WORKS, Limited, : Sussex, N. B.

THIS PLANT SAVES-

TIME
LABOR
MONEY





THINK, $234 a year saved on only nine of the necessary chores about the farm. Picture the many other jobs that could be time and labor lessened.—Picture the convenience of an electrically lighted house and barns. Figure how much more money you could bank yearly if you farmed with the twenty-four-hour-a-day help of

Northern Electric
POWER AND LIGHT

From a dollar and cent viewpoint—electrifying your farm is the most far-sighted investment you could possibly make—your yearly production jumps immediately. Your live-stock increases in value, for clean, sanitary surroundings make contented cattle.

Fresh running water is a boon to any farm.—Not only in the barns and dairy, but for sanitary purposes in the household, the Northern Electric Plant will cheaply and efficiently pump all the water you need. In case of fire it is ready for immediate service.

Power milking and dairying will enable you to keep more cattle. The demand for milk, cream and butter offers you rare opportunities.

The women folk on the farm find in electric power the solution to health-breaking tasks. All the labor-saving of modern electrical appliances is theirs with Northern Electric Power and Light.

You can electrify your farm with Northern Electric Power and Light for less than your hired man costs you for one year's work, and what you now pay for coal oil will maintain and operate it.

There is a Northern Electric Power and Light Plant in the size your farm needs. Our nearest house will send you interesting literature upon request. Write to-day.

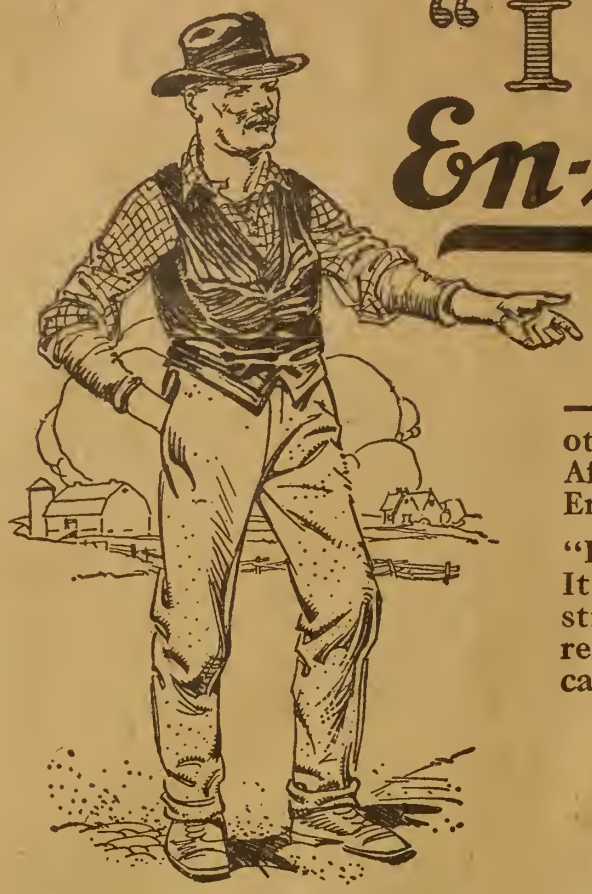
"I have found En-ar-co Motor Oil helps me"



—to get more power out of my tractor, automobile and other farm engines without wearing them out quickly. After trying other lubricating oils, I decided to stick to En-ar-co.

"En-ar-co Motor Oil solves most of my engine difficulties. It makes things run smoother, and never gets hard and sticky. They tell me that's because it's scientifically refined, so there's no possibility of clogging matter or carbon deposits."

That is the testimony you will hear from every Canadian farmer who has given En-ar-co Motor Oil a trial on his farm.

All En-ar-co Products are Best for the Farm

White Rose Gasoline

Gives greater power and puts "pep" into your engine.

National Light Oil

Clearer light in lamps and lanterns; steadier warmth in heaters, brooders, incubators. Best fuel for tractors.

En-ar-co Motor Grease

For differentials—gears—transmissions, on motor cars and tractors.

Black Beauty Axle Grease

Takes the grind and squeak out of axles, and ensures smoother running and longer wear.

Order En-ar-co Products from your local dealer. If he hasn't got them, write us and we'll see you are supplied promptly.

How En-ar-co Motor Oil is Produced

You've seen the hard "scale" that forms in the bottom of your water kettle when the water is boiled away into steam. If you cooled, or "condensed," the steam, you would have absolutely pure water.

Crude petroleum is purified into En-ar-co Motor Oil in a similar way—in great 25,000 gallon kettles or "stills." Intense heat vaporizes the crude oil as water is vaporized into steam in your water kettle. When this vapor is condensed and further refined, you have En-ar-co Motor Oil—an absolutely perfect lubricant.

It forms a strong, velvety cushion for all moving parts of your engine and will not clog them with excessive carbon.

Only trained workmen—no "greenhorns"—are entrusted with this process. That is why every barrel of En-ar-co Motor Oil is of the same high grade.

What En-ar-co Motor Oil Has Done

It has passed the most rigid government tests for lubrication purposes.

It satisfied all Government requirements for airplane use. Thousands of gallons were used in airplane motors during the war.

It has enabled thousands of Canadian farmers to reduce friction in their farm engines, and obtain greater power and longer life for these engines.

Send for Our FREE Auto Game

A fascinating game in which autos compete in a cross-country race will be sent FREE to any auto, tractor, truck, motor boat or engine owner who will fill out the attached coupon and mail it to us.

Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, AUGUST 3, 1920. Number 22.

Preliminary Investigations Re Lime Requirements of the Soils of N. B.

By E. M. TAYLOR

The object of this investigation was to determine whether the soils of New Brunswick were acid or sour in reaction, and if sour, what was the degree of acidity present, and what was the effect on crop production. The method of procedure adopted was to obtain representative samples of soil from various parts of the province, make a laboratory estimation of the lime requirements and to follow this up with field experimental work. Unfortunately, this latter phase of the work has not yet been executed.

The following table gives a brief summary of the laboratory estimation of the lime requirements of the soil in different districts of the province, expressed as the amount of carbonate of lime (ground limestone) required to neutralize the acidity per acre of ground:

County.	No. of soils tested.	Pounds limestone required per acre.
*Restigouche	3	5150
**Gloucester	42	5683
†Northumberland	30	4085
‡Kent	20	4681
Kings	44	5690
Albert	10	6690
§Queens	8	6262
York	25	6322
Carleton	35	6553
Victoria	29	5876

*Two of these soils were underlaid by a strata of limestone. Their lime requirements were approximately two tons per acre less than the soil which was not underlaid by this formation.

**Soil No. 202 from Petit Rocher underlaid by a strata of limestone, showed a lime requirement of only 1,500 pounds per acre. Soil No. 208, from Bathurst, which was heavily limed six years ago, showed a lime requirement of only 300 pounds per acre.

†Three soils from Chatham which had recently received applications of lime and ashes, required respective applications of 300, 600 and 1200 pounds per acre.

‡Soil samples from St. Charles, Upper Rexton and Mundleville, which had received applications of mussel mud showed lime requirements of 600, 200 and 270 lbs. per acre.

§Soil No. 249, from Gagetowu, which was limed 10 years ago, showed a lime requirement of only 3,000 lbs. per acre.

The conspicuous feature of the above figures is the apparent degree of acidity in New Brunswick soils. The effect of an application of some source of lime has been to reduce the acidity. Soils which have been recently limed show a reduction of the acidity proportional to the amount applied.

The results of these laboratory estimations are indicative, but the investigation is in no way complete until these results are substanitated by comprehensive experimental work in the field.

Importance of Lime in Agriculture.

In the role of soil fertility lime plays an important part. Plants require lime as part of their mineral food. It is not generally considered necessary, however, to supply lime as a plant food. Two tons of timothy hay per acre would remove from the soil the equivalent of 11.4 pounds of carbonate of lime. The requirement of the clover crop, however, is more significant. Two and one half tons of red clover hay per acre would remove from the soil an amount of lime equivalent to 113.5 pounds of carbonate of lime.

Probably the most important function of lime is that in the form of burnt lime, and ground limestone or carbonate of lime, it is a neutralizer of soil acidity. Now, an acid condition of the soil is not the most favorable for the growth of many of our farm crops. A factor which is becoming a problem to the turnip growers of the province is the increasing prevalence of the fungus Plasmodiophora brassicae, which causes club root in turnips, cabbages and other closely related plants. This fungus finds in an acid soil conditions particularly favorable for its development and continuity.

Lime to some extent seems to act as a liberator of plant food in the soil. The phosphoric acid in the soil exists in the form of salts of lime, magnegium, iron and aluminum. The phosphates of iron and aluminum, on account of their insolubility, are comparatively unavailable. Phosphates of lime under various stimuli in the soil are much more available for plant nutrition.

When soluble phosphates, such as acid phosphate, are added to a soil deficient in lime, they tend to revert to unavailable compounds of iron and aluminum. In the presence of an abundance of lime larger amounts of the phosphoric acid will combine with it to form phophates of lime instead of the less soluble phosphates of iron and aluminum.

The potash in our soils is largely locked up in unavailable form. The use of lime in the soil tends to promote the availability of this element. The organic matter in the soil consists largely of plant residues. These residues contain the nitrogen which in time becomes available to plants for their growth. Before it can be utilized for growth, it must be converted into the form of a nitrate. In this process two reactions are involved and affected by bacteria in the soil. The efficiency of these bacteria is greatly reduced by an acid condition of the soil. Inasmuch as plants require nitrates for their growth, this process is an important one.

Associated with the leguminous plants such as the clovers, peas, beans, etc., is a group of bacteria which lives in nodules on their roots. These bacteria, under favorable conditions, are able to appropriate appreciable amounts of nitrogen from the air and add it to the soil. These organisms are not able to function properly in an acid soil and require for their maximum activtiy an abundance of basic material in the soil such as carbonate of lime.

Lime for Agricultural Purposes.

For the neutralization of soil acidity lime may be used in different compounds. It may be used in the form of oxide of lime or the carbonate of lime.

Burnt lime, or oxide of lime, is caustic in nature. Its use on light soils which are poor in organic matter, is not to be recommended on account of its action in reducing the organic matter. It is quick in action, and on heavy soil which has an abundant supply of humus it can be used in medium quantities quite safely. For correcting acidity, 1120 pounds of burnt lime is equivalent to one ton of carbonate of lime, or ground limestone.

Ground limestone carries its lime in the form of carbonate of lime. As a neutralizer of soil acidity it is not as quick in action as the burnt lime. The rapidity with which it acts will be largely governed by the fineness of the material. For quick action 75 per cent. of it should pass through a sieve of 100 meshes to the inch. Not being caustic in nature, large applications can be made without fear of injury to the soil. When applied it should be thoroughly incorporated with the soil.

Sources of Lime in the Province.

There are distributed over the province a fair number of limestone deposits; some of which are of excellent quality. The following table gives the location of some of the more accessible deposits and their quality:

County.	Locality.	Per cent. carbonate of lime.
Albert	Demoiselle Creek	92.75
"	" "	79.37
"	Hillsboro Quarry	82.75
"	Elgin	95.31
Carleton	Florenceville	77.80
"	Hartland	87.87
Gloucester	Tetagouche	81.00
"	Elm Tree	97.25
"	"	70.00
"	Petit Rocher	88.75
Kings	Havelock	96.97
"	Sussex	83.81
"	"	81.34
Queens	Queenstown	94.00
"	Carpenter	93.00
"	Petersville	91.18
St. John	St. John	93.15
Victoria	Plaster Rock	63.60
"	Arooostook Jct.	38.45
Westmorl'd.	Taylor Village	96.25
"	Up. Dorchester	84.80
"	"	57.19
"	"	53.98
"	Petitcodiac	97.55
York	Keswick	60.15

Mussel Mud

Mussel mud is a marine deposit frequently found at the mouth of tidal rivers. It consists of a fine silt containing variable quantities of oyster, mussel and clam shells. Inasmuch as the shells are largely carbonate of lime, they often are a valuable source of lime for agricultural purposes. The lime content of this material is dependent upon the percentage of shell present. Analysis of a sample of silt separated from the shells showed it to contain only 4.75 per cent. carbonate of lime. Analysis of the shell showed it to contain 87.5 per cent. carbonate of lime. From this data the importance of obtaining mud with a high shell content is obvious. Extensive beds of this material are found all along the eastern cost of the province, and their utilization is of no little economic importance considering the requirement of our soils for lime.

Limits of Investigation.

This investigation dealt only with the lime requirements of the above soils and does not in any way refer to their nitrogen, phosphoric acid and potash content. Soil fertility is not the result of any one factor, byt of several factors intimately linked together. Lime cannot take the place of either fertilizers or barnyard manure. It has a function to perform: maintain the store of plant food and humus in the soil, regulate the drainage, and then that the full benefits of these conditions may be derived, keep the soil sweet by the use of lime.

The bottom has apparently dropped out of the hide market. A drop of 15 to 20 cents per pound in the price of hides makes quite a difference in the value of an animal. If the price of leather goods would drop accordingly, neither producer or consumer would have much complaint, but when buying a pair of shoes or a set of harness, one is not aware of any drop in price.

Regularity in feeding and uniformity of feeds, both as to quantity and quality, are essential.

Notes From the Nova Scotia Agricultural College

N. S. A. C. TERM OF 1920-21.

On another page of this issue will be found an advertisement of opening date and courses offered at the Nova Scotia College of Agriculture. Tuition is free at this institution for all students from the Maritime Provinces. Young men who desire to prepare themselves for a successful farming career cannot obtain anywhere in Canada a more satisfactory course of training than is offered at Truro. Those who wish to take up professional work along any agricultural line can profitably take their first two years here and finish at Guelph, MacDonald, or some other Canadian College.

It is a noteworthy fact that former students who have followed this latter plan, have almost invariably been at the head of their classes in the institutions where they have finished their training, and some of them are today occupying foremost positions in Canada in their chosen line of work.

FIBER FLAX

A splendid field of fibre flax is now maturing at the College farm, Truro, This will be pulled in a short time, and it is planned to ship the product to a flax mill near Montreal. The seed was specially imported from Ireland through the Dominion Department of Agriculture.

The crop just now looks very promising, and at least suggests the desirability of a group of farmers in some Maritime locality agreeing together to grow one, two or three acres each, to make up from 500 to 1,000 acres of flax, which would be sufficient to warrant the establishment of a flax mill in that locality. Fuller reports will be published at a later date.

DAIRYING NOTES.

Tell it not in wholesale Gath! Creamery butter is now selling at 58 to 60 cents per lb., as compared with 53 to 54 cents a year ago. This at a time when general farm produce is beginning to show sharp declines. The firm price of butter is at least partially accounted for in the splendid organization at the present time all over the Dominion for the marketing of dairy products.

The strength of the butter market should be taken into consideration by farmers who are readjusting their plans and selecting the line of work they are to specialize in. Already many sections of Nova Scotia which once scattered their energies over lumbering, fishing, etc., are centralizing on dairying, with splendid results.

This year is showing the biggest increase in output from creameries yet attained. At the first of July it was estimated that the total creamery product was 40 per cent. larger than it was at the corresponding date last year. At the time of writing the cream supply is dropping off, owing to the scarcity of rain, and consequent dry pastures. The falling off is much more marked where the farmer has depended on old pastures. Those who have applied modern methods of fertilizing and bringing the pastures into the crop rotation have suffered much less.

Especially well off this season is the dairyman who put in an early soiling crop in the spring, and is now able to supplement with green fodder so as to hold up his cream supply. Seasons like the present one accentuate the difference in productiveness also, between old methods and fields which have been left to mature and those which have been properly cultivated. In practically all parts of the province where the land has been kept in good condition the hay crop will be up to normal or very nearly so. To the observer of wide areas it is evident that the man who has striven to develop his dairy production is the man who also has secured best results in hay, grain and root crops as well.

Complains of variation in cream tests are now at their climax, especially among new patrons. With no errors whatever there is bound to be more or less variation. The principal source of trouble is the hot weather and consequent souring of cream. Cream that is sour or partially so should be well stirred from top to bottom before leaving the farm, so that an accurate test may be obtained. Every precaution should, of course, be taken to prevent souring altogether.

Apart from this principal cause, which can thus in some meature be remedied, the main factors in variation are as follows:

1. Milk from a single herd will vary in fat content from day to day, sometimes to a considerable extent, this variation affecting the percentage of fat in the cream, even when the volume of cream remains exactly the same, and separator conditions are unchanged.

2. Cream separated at a high temperature, say 95 degrees, will give a lower test than when separated at, say, 70 degrees.

3. If the milk inlet on the separator be partially shut off the cream will show a higher test than if left wide open.

4. The separator will do its best work when run at the speed indicated on the machine. Higher speed reduces the quantity of cream and raises proportionately its fat eprcentage.

A very clear account of the whole problem of variation in cream test is given in a circular which may be had from any creamery manager, or from the Dairy Division at Truro by dropping a card. The title is "Causes of Variation in the Percentage of Fat in Hand Separafor Cream."

A BUSY DEPARTMENT.

Almost every vegetable the farmer or market gardener seeks to grow has one or more small but deadly foe. The business of the Entomological department is to find ways and means of overcoming these pests. Your correspondent recently had a glimpse into the field work of this very busy department. Its activities to the untrained observer seem to fall into primary and secondary classes.

1. The first step is to study the life history of the insect to be attacked, so as to determine the stage at which it is most susceptible.

The next step is to discover by experiment what poisons are most effective.

2. More or less consequent on these matters are many others, such as: What preparations are least costly? What is the minimum dose necessary? What arrangements can be made for the manufacture of these preparations?

This year the work on the college farm under this division has to do largely with the cabbage maggot, onion maggot, carrot rust fly, pea moth, and to make more accurate and certain to the public the effects of the beetle and blight on the potato yield, and the comparative value of Bordeax dust and liquid Bordeaux in combatting the latter. There is also experimental work being carried on to determine which poison gives best value in destroying the potato beetle and what is the minimum dose necessary.

Several effective poisons have been tried out in dealing with the cabbage maggot. An exhaustive test of these is being carried forward this year, and it is expected that valuable results will be available to the public at the close of the season. The difference between the plots of cabbage which have been treated with some seven of these poisons and the check plots, on which no application of any kind was made, is very striking.

With soil and seeding conditions exactly alike, the treated plots show very few blanks, while the plots which were left to themselves have a lone head here and there. Any observer, looking over the field, cannot but be struck with the value of experimental work which will place these preventatives within reach of every vegetable grower.

The tar paper disk is now a back number. Salt solutions are useless and worse, but any one of seven poisons being tried ou this year will make unnecessary further heavy losses in the cabbage plot. Which of the seven is most effective, easily obtained and inexpensive should be demonstrated bythis year's experiments.

The onion maggot experiments are not so promising. A number of materials are being tried out, some of them giving a afir degree of control. As yet the posions discovered are too expensive for use in practical conditions. No general recommendation can be given out at present for the control of this pest, but every effort is being made to this end.

The infestation of carrot rust fly has been too light this season to give conclusive results. The main difficulty with the pea moth is to find material adhesive enough to stick to the flower sepals where the eggs are laid.

The most definite results reached so far in relation to this list of foes, with the exception of potato beetle and blight, then, apply to the cabbage maggot. The department invites correspondence from any one who has suffered from these pests. Occasionally the men in charge hear of some farmer or market gardener who has suffered heavy loss unnecessarily. It is for the assistance of such that they are working and advantage should be taken of the results obtained.

KEEP UP THE GOOD WORK.

The recent articles which have appeared in this and other Maritime papers have brought in upwards of two hundred letters from parties seeking information regarding the use of Bordeaux Mixture and dusting materials for treating potatoes to prevent rot. This is in itself sufficient testimony to the fact that spraying and dusting is being carried on more extensively than in any previous year.

A word of warning to beginners in this vital practice may now be apropos. College men state that, on the basis of former experience, they fear that many farmers may not be persistent enough to reap the full benefit. So long as there are bugs present, the foes of the potato cropp can be seen, and the necessity of spraying is evident to all. The spores which cause blight, and therefore are equally deadly, cannot be seen until the destruction is largely accomplished. The temptation of the inexperienced is to stop spraying when there is no visible foe. This paragraph is written to emphasize the fact that high results cannot be expected unless the field is sprayed from four to six times during the growing season.

It may be rather early to add another bit of advice and warning, but since it is along the same line it may be set down here. It is this, that rot in potatoes is often greatly increased by the practice of covering heaps of potatoes after digging with tops, for the purpose of protecting from frost until they are housed. If these tops have any blight on them, the spores wil drop on the potatoes and rot will develop after they are stored. Tops should not be thrown over the tubers unless there is certainty that they are free from this or any other kind of plant disease.

DANGER FROM NEW DISEASES OF WHEAT.

(Experimental Farms Note.)

Aside from rust and smut, Canadian wheat crops have been found remarkably free from destructive plant diseases. Recently, however, there have been discovered in the United States two new diseases, "Flag Smut" and "Take All" about the presence of which there has been felt considerable alarm. Now, up to the time of writing, Canada has not been invaded by either of these new troubles. But growers should be ever on the lookout for these and any other obscure trouble with which their practice has not made them thoroughly familiar.

"Flag Smut," so called because the smut occurs on the flags or leaves of wheat, is easily recognized by the long streak of smutty stripes running along the leaves. The affected plants also show a peculiar tangled and twisted appearance as if the leaves were wound around the stem. Any suspicious plant should be sent to the Division of Botany, Experimental Farm, Ottawa.

"Take All," as the name implies, takes all and is probably the most serious wheat disease known with the exception of rust. In certain countries, indeed, it is the more serious, as is emphatically claimed by the practical grower as well as the scientific observer. The recognition in the field is not difficult. "Take All" is a root disease spreading from below up the stem for about 1 to 2 inches, discoloring the stem dark brown. The affected plants may be pulled up very easily, their anchorage in the ground is very loose as compared to a sound plant. The affected plants turn yellow and finally die, taking straw and all. Both diseases are most likely conveyed by infected seed grain, hence it is most important to "nip these diseases in the bud" and report all suspiciou cases at once. The use of foreign wheats for seed is cautioned against; particularly wheat from Australia is under suspicion.

MY FIRST YEAR WITH A DUSTER.

(By L. W. Staples, Bowdoinham, Me.)

When the buds began to show pink, I selected a calm morning about an hour and a half before sunrise. A boy to drive the horse—a fast walker—100 pounds of dust in the hopper and 100 pounds more in a bag beside me, and in an hour and a quarter we came in to breakfast, knowing that we had dusted more trees than we could have sprayed in a full day.

We looked back over the orchard and, behold, the dust was still hovering in the tree-tops like a dense fog over a sea. Two hours later we went down to investigate and the dust had settled and was clinging to every twig, bud and leaf of the trees.

Thus we kept on, morning after morning, till every bearing tree was covered. The pink bud dusting was mainly to control apple scab, sooty fungus and aphis. Two weeks later, when the leaves were showing green, we administered the second dusting, for control of scab, but-moth and sooty fungus. A third, for the codling moth, just after the blossoms fell; a fourth, in two weeks, to kill any surviving pests, and later in the season to combat a slight appearance of scab and sooty blotch. Those completed my season's work.

Grass in the spring has some medicinal value, but at this time of year it is a poor substitute for grain and good hay.

REPORT OF AGRICULTURAL CONDITIONS IN NEW BRUNSWICK

As Reported by District Representatives of the Department of Agriculture.

Fredericton, July 20, 1920.

Reports of the past week show that considerable clover hay has been cut throughout the provoince. The hay crop has thickened up considerably, which will increase the yield. On the high-land it will be short. Taking the province as a whole, it would seem that a reduction of twenty-five per cent over last year's crop could be given as a fair estimate. Two weeks ago an estimate of one-third less than last year was given, but recent rains have thickened the crop up wonderfully, although coming too late to give it much more length.

Grain crops are doing well and give promise of a very satisfactory yield. Early reports of misses in the potato crop in Carleton and Victoria counties are constantly being confirmed. These vary all the way from twenty-lve per cent. to as high as sixty per cent. of the crop in some sections. The loss sustained by some growers will be very heavy. The total production of potatoes from these sections will also be lessened very materially. On the north shore and eastern part of the province the potato crop continues to look well and is very promising. Some blight is reported in the Blissfield section.

Pastures have been better since the rains and the milk production is keeping up fairly well. Prices of dairy products have not changed very much. There is a heavy export demand, which takes up all surplus Canadian products.

The apple crop is suffering by a very heavy drop. This has been abnormally heavy this year and in some orchards has left a very light crop. In those orchards that have been well sprayed, the fruit is clean.

NOTES ON THE PRESENT WOOL SITUATION.

Everything at the present time points to a lower level of prices as compared with those obtained on the 1919 clip. Just where that new level will be, however, is a point upon which there is much speculation and very little agreement. No one really knows what to expect in the market for the next two or three months and consequently very little is being done except "playing safe" in the matter of consignment on a sufficiently low basis of advance, or in the few instances where buying has occurred, giving a price in keeping with the feeling of the trade.

For the immediate present, no market exists and the general dullness is perhaps best reflected in the lack of interest on the part of the dealing trade. It has virtually withdrawn all buyers from the field or limited their activity to the handling of the product on a consignment basis. One of the chief reasons for this state of affairs lies in the fact that buyers of yarn and woolens have been forced to cancel orders previously made, on account of general trade conditions. As a result, these cancellations in the trade have piled up so high on the manufcaturers, particularly in the United States, that they have been forced to reduce their production stocks, forcing prices below actual cost and wool merchants in an endeavor to protect themselves, have called a halt on additional purchases of wool in the country, until trading improves. At present, noboby seems to know what wool is worth, and because of this dealers refrain from making offerings until such time as manufacturers show a greater willingness to buy.

In addition to the trade cancellations, the following facts bear indirectly on the wool market: the general tightness of money, stocks of wool in hand particularly in the lower grades, and lastly transportation and the general unsettled state of business.

The one bright spot in the whole situation is that all authorities seem to be of the opinion that the present lull is only temporary. The British situation has been summed up recently as follows:- "We are still of the opinion that the present lull is only temporary, and although it is not likely, nor indeed desirable, that prices should go back to their recent high level, we believe that in the course of a couple of months or so, business will revive." This shows that confidence in the British wool trade has not been destroyed.

The feeling on the American market is very similar and there as in Canada, consignment seems to be very uch the order of the day. This is as it shóuld be, and growers are well advised this season to seriously consider the selling advantages offered by the Sheep Breeders' Association found in every province of the Dominion.

ST. JOHN EXHIBITION EDUCATIONAL DEPARTMENT.

The St. John Erhibition Association are attempting this year a display in the Natural History Department that will be more comprehensive and of greater educational value than anything that has been attempted for some years. This exhibit, which will be under the able management of Dr. Wm. McIntosh, curator of the Natural History Society, will deal with the minerals, forests and animals, bird and insect life of the province. It is planned to make the exhibit not only educational, but also extremely practicable, e.g., in the matter of our forest wealth exhibits will include a section of the trèe in its natural state, the polished grain, a legend showing in what section of North America the species is found, specimens of the manufactured products obtained from that particular tree, with a classification of the products, those manufactured here distinguished from those made elsewhere. The object is to bring clearly home to the people of these provinces the extent to which the raw materials are being exported and the profits of manufacture reaped by outsiders; in short, the exhibit is being planned with the definite object of showing the people of the Maritime Provinces the possibilites latent in these provinces and the New Brunswick Provincial Government is giving every co-operation it can to the project.

HOW I GREW MY PRIZE-WINNING POTATOES.

Mr. Geo. E. Sanders, Annapolis Royal, N. S., has handed the Maritime Farmer the following story depicting how Mr. Anexander McPherson, Presque Isle, Maine, won the prize last year for the best potato grower in the Eastern United States. Our readers will be interested in the methods followed. Every potato grower who reads this story should note the frequent sprayings, compare Mr. McPherson's methods with their own, and profit by his methods:

The soil was a deep gravelly loam with a slope to the south. I cut the hay on it for two years. The first crop was mostly alsike and red clover; the second a light crop timothy, about a half-ton to the acre. I let the second crop lie and applied ten seventy-bushel loads of manure to the acre and plowed it under in spare times during the summer.

The following spring we harrowed the ground once before we applied ten more spreader loads of manure to the acre. After that we harrowed it three times to pulverize the ground and make it mellow for planting.

Planting commenced May 13 and we finished May 14. We used twenty-two bushels of choice Irish Cobbler seed to the acre. This seed was taken from a field off my own raising which yielded 457 bushels to the acre the previous year.

In cutting seed for the crop, I cut the pieces as square and large as the planter would wandle. The seed was dropepd ten inches apart in the row and the drill rows were two feet nine and three-fourths inches apart. I used 2,200 pounds of a 4-8-4 (four per cent. ammonia, eight per cent. phosphoric acid, four per cent. potash) fertilizer in the drill at planting time. The planting was done with a two-man planter which drops the fertilizer first, and which has an attachment that covers the fertilizer so that it will not come in contact with the seed.

The seed was covered three inches deep. In about three weeks the potato plants began to come through the ground; and then we commenced to ridge them the way we do in Aroostook county. At this time, also, we applied a ton of a 4-8-6 fertilizer to the acre, dropping it in the centre of the drill before we began ridging.

The ridging, which was done with a horse-hoe, covered the fertilizer, potato tops, and all the weeds which had started to grow. This second application of efrtilizer was put on with the covering attachment taken off.

A few days after the first ridging the plants were through the ground again. We cultivated with the horse-hoe five times.

We began spraying the field when the plants were five or six inches high, using a two-horse sprayer with a barrel holding 100 gallons. When the plants were still young and tender we used Bordeaux 5-5-50 formula; that is, five pounds of lime, five of copper and fifty gallons of water. As the plants got older we used 6-6-50. We sprayed nien times during the season.

There were two periods of about three weeks each, when we had no rain. The plants wilted during the day, but in the morning looked refreshed from the dew.

Considering the growing season and the kind of potatoes planted, I was well satisfied with my crop. I sold the whole crop at $4 a barrel just as it was dug in the field, furnishing the buyer a storehouse to load from.

In figuring my expenses, something ought to be allowed for the extra-fine condition in which this prize-winning field is left, because of the heavy application of manure and fertilizer.

The following is the expense account, with net profit figured out:

Rent of ground, $25 an acre	$125.00
Plowing, $4 an acre	20.00
Picking rocks, 60c. an acre	3.00
Ten and one-half tons fertilizer	849.00
100 tons manure at $3 a ton	300.00
Hauling fertilizer	50.00
Harorwing five acres four times at 75c an acre	15.00
8 barrels seed per acre at $4 a barrel	160.00
Cutting seed, 40 barrels, at 35c a barrel	14.00
Planting, two men and team, $2.50 an acre	12.50
Hauling material to field	5.00
Cultivating and hoeing five times	30.00
Hand hoeing	10.00
Vitriol, 250 lbs., at 11c a lb.	27.50
Lime, 250 lbs., at 2c a lb	5.00
Poison, 10 lbs., at 35c	3.50
Spraying labor, nine times, 75c an acre	33.75
Picking 971 2-3 barrels, at 12c a barel	116.60
Hauling one mile to shipping station, 5c a barerl	48.60
Storage, 10c a barrel	97.-0
Digging, $4 an acre	20.00
Depreciation on horses and machinery ($2,000)	30.00
Total cost of five acres	$1,975.55
Received for crop	3,886.66
Profit from five acres	$1,911.11

GAINS FROM POTATO SPRAYING.

(By G. E. Sanders, Annapolis Royal.)

Of all farm operations, spraying the potato crop is without doubt the most profitable. Low prices almost invariably mean a loss to the man who does not spray, but prices seldom get so low as to cause the man who sprays thoroughly to sell below cost.

Some of the following results obtained in 1919 may serve to convince readers as to the necessity of thorough spraying in the growing of potatoes.

At the Kentville Experimental Station in 1919 the results were in bushels per acre:

Sprayed 4-4-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
519.25	4.41	20.83	546.15

Unsprayed—

Marketable.	Rotten.	Small.	Total.
222.75	228.25	2425	472.75

Spraying four times here gave 296.50 bushels more shipping potatoes per acre, 73.41 bushels more total yield per acre, 3.42 bushels fewer small potatoes per acre, 223.64 bushels fewer rotten potatoes per acre.

At the Fredericton Experimental Farm, on acre plots, in 1919, the results were in bushels per acre. Fertilizer.

Sprayed 4-4-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
398	0	14	412

Dusted, Copper Arsenic Dust—

Marketable.	Rotten.	Small.	Total.
378	8	28	414

Untreated—

Marketable.	Rotten.	Small.	Total.
221	77	23	321

In another experiment at the Fredericton Experimental Farm, the average of plots sprayed with different strengths of Bordeaux and with poison alone gave in bushels per acre:

Sprayed 6-6-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
334.4	55.05	34.6	424.15

Sprayed 4.4-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
269.72	73.13	38.31	395.11

Sprayed 2-2-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
235.7	86.7	30.9	355.5

Sprayed 1-1-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
203.	124.2	33.8	362.5

Sprayed poison only—

Marketable.	Rotten.	Small.	Total.
127.8	121.9	23.5	273.5

No spray—

Marketable.	Rotten.	Small.	Total.
109.3	74.9	34.3	218.5

In still another experiment at the Experimental Farm in Fredericton, a large number of plots averaged in the same manner as the last experiment gave in bushels per acre:

Sprayed 4-4-40 Bordeaux—

Marketable.	Rotten.	Small.	Total.
311.14	51.29	31.83	394.15

Sprayed poison only—

Marketable.	Rotten.	Small.	Total.
164.9	101.5	23.6	290

No spray—

Marketable.	Rotten.	Small.	Total.
92.2	93.	28.7	214.2

On account of the above being averages the totals do not add up right in all cases. In view of the fact that it costs only twenty dollars to spray an acre of potatoes five times with poisoned Bordeaux, and that sound potatoes seldom sell for less than $1.25 per bushel these days, one can easily see from the above figures that the potato grower is neglecting a fine business opportunity if he neglects to spray with the proper materials.

On an average it costs $150 to grow and harvest an acre of potatoes. With potatoes at $1.25 per bushel, two of the four untreated fields would meet a loss, while one of the fields treated for insects only, would show a deficit. In all cases, the fields sprayed with poisoned Bordeaux would show a handsome profit at the same figures with the additional cost of spraying and handling the extra potatoes added to the cost. In fact in one of the sprayed fields the potatoes could have sold for thirty-three cents per bushel and paid expenses.

A good many horses lose some flesh and shrink slightly in the shoulders during the busy spring weeks. In such a case the collar and draft should be adjusted in order to prevent sore shoulders.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark
Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

AUGUST 3, 1920.

WHAT SHALL THE HARVEST BE?

About this time last year the Potato Crop in the Maritime Provinces gave promise of a bountiful yield. The vines were vigorous and of good color. Starch was being rapidly manufactured and transferred from green leaves through stem and stolens to the miniature tubers underground, and these tubers in turn increased in size from day to day so that on an average of from five to ten bushels was the increase per acre per day. Men who appreciated the value of thorough spraying, sprayed once, twice and not a few four, five and some six times, with the result that when Late Blight set in in their respective neighborhoods, their fields kept green and from day to day their stock of potatoes was increased per acre at the rate already mentioned. Then came the harvest to them with bumper yields of sound, healthy, well matured tubers. What of the neighbor who did not spray? His crop at this time of the season looked every whit as good as his neighbors, but being one of the foolish virgins, he heeded not the sound advice sounded through the press, and from the public platform by such an authority on potato spraying as Mr. Geo. E. Sanders, whose writings on this subject must be familiar to every farmer who reads the agricultural or weekly press.

Harvest time came to them too, but Early Blight had gotten there first and as a consequence its ravages was rife and a short crop resulted, for, every day that Blight cut off the life of the potato plant short of its natural life period, the loss to the farmer was from five to ten bushels per acre. And the shortage in the yield was not the worst result. The tubers that had attained marketable size had been attacked by rot, the direct result of Late Blight, to the extent of anywhere between twenty and sixty per cent. These are the estimates of the damage caused by rot as submitted by one hundred and forty-five of the one hundred and fifty-three Agricultural Societies in New Brunswick when forwarding their annual reports in the fall of 1919.

The cost per acre for plowing, harrowing, fertilizing, seed, cultivating and the other items that enter into the cost of production was approximately the same on the farms of both the spraying and non-spraying farmers, but the former had insured his crop by spraying, an operation that cost him approximately twenty dollars per acre, whereas this amount in time and labor was (saved)? by the non-spraying farmer. Saved! Yes, and lost too. "Penny wise and pound foolish". Never before in the history of the province was there a stronger demand for potatoes at such high prices as existed during the past eight months. The farmer who grew the big crop and saved it too received a rich reward. He received many times the value of the extra twenty dollars he had put into spraying per acre, more than he would have received if he had not sprayed. This extra investment had netted several hundred per cent. profit and there was a wide range btween the cost of production and the selling price—all profit. A four hundred or more bushel crop nearly all marketable.

What of the non-spraying farmer? From twenty to sixty per cent. of his small crop was unmarketable. Of a two-hundredand fifty or less bushel crop in many instances one hundred and fifty-bushels or more were rotten and unmarketable and the margin between cost of production and value received was very narrow, is not on the wrong stide of the ledger. An expenditure of about twenty dollars in time and money for thorough spraying per acre would have saved this loss and increased the yield of marketable potatoes to that of a handsome profit. This is no idle theory. It has been tried and proved by the most successful growers of all countries where potatoes are grown.

What shall the harvest be this year? The total yield in some sections will be very materially shortened by the large percentage of misses in the fields. These misses are attributable to several causes. Prospects are bright for high prices. Reports from up-river districts are to the effect that buyers are now contracting for six dollars per barrel and advancing from three to four dollars per barrel on the estimated yield. We have received these reports from fairly authentic sources and if they be true the farmers who grow big crops of potatoes this year will be handsomely repaid for their labors. Any indication of a short crop should be an extra inducement to make the best of the crop you have.

What are you doing, reader, as a potato grower? It matters not whether you have many acres or only a portion of an acre under crop. Your gain or loss will be commensurate with your acreage is to whether you spray or do not spray. Spraying should have been well under way during the month of July but if you did not spray then begin right away and ward off the Late Blight as long as possible. You may say, I haven't time. If you have the growing crop there is no better work that should supercede spraying at this season. It will give you better returns than any other work you could possibly do on or off the farm with so little expenditure in time and money. It is penny wise and pound foolish to spend several hours on a job that will yield returns of only two or three dollars when potato spraying giving returns of many times this amount should be performed instead.

Potato beetles are rife in many section this year and already Late Blight has put in an appearance. A word to the wise is sufficient. The writer of this article has had the privilege of accompanying Mr. Geo. E. Sanders on a lecturing tour in the interests of potato spraying, in 1919, and again during the past two weeks. It is most gratifying to hear progressive potato growers at these meetings ask questions and get all the information they can to help them in their work. Men of this calibre are after all the information they can get to help them get bigger and better crops and consequently more money for their labors. On the other hand it is — — — to go to a district where spraying is not carried on, where potato beetles have trimmed the stalks and where blight completes the devastation and there find a lack of interest. Of the twenty-four meetings recently held in St. John, Kings, Westmorland, Restigouche, Gloucester and Northumberland counties twenty-two were successful with an average attendance of fifteen farmers. The attendance at the other two meetings was one, but a little leven may leven the whole lump and consequently some benefit may come to those districts and the word spoken may not after all be in vain for it is surprising how much influence for progressive measures even one successful progressive farmer may have in his district, and how the rank and file will almost inadvertently follow the practices which are bringing success to his labors.

Be hearers, readers and doers.

THE ST. JOHN EXHIBITION.

The 1920 Maritime Circuit of fall fairs will open at St. John, N. B., on Saturday, Ceptember 4th, at 6 p.m. This will be St. John's first post-war exhibition. The association's buildings having been occupied in war time by the military authorities, precluding the holding of the usual biennial Industrial and Agricultural Fair since 1914.

The prize list is now in the ahnds of the public and in it are found many attractive features and monies of sufficient dimensions to make competition worth while.

In the horse classes ,prizes range from $30.00 and downwards. The heavy draught, 1400 lbs. and upwards; agricultural, 1350 and under 1500 lbs., and general purpose 1150 to 1350 lbs. classes are well provided for and should be a big feature of the show as there are now exceptionally fine teams of these classes owned by many of the farmers within easy reach of St. John.

In the Beef Breeds section there is a class for Milking Shorthorns. To be eligible for this class bulls should be out of cows of proven milking ability; heifers likewise until they make their own milk record. The standard for milking ability to be the same as for the Canadian Record of Performance, which is:

Two-year-old class ... 4,000 lbs. milk, 140 lbs. fat.
Three-year-old class .. 4,500 lbs. milk, 157 lbs. fat.
Four-year-old class ... 5,000 lbs. milk, 175 lbs. fat.
Mature cows .....5,500 lbs. milk, 192 lbs. fat.

for a period not exceeding 356 consecutive days; all cows must be bred to calves within fifteen months from the date of her preceding calf birth. Females over three years old should have records of their own in accordance with the above figures to qualify for admission. Exhibitors should be prepared to produce a certificate as to their milk records. There will be a special diploma for best female with a milking record of not less than 7,000 lbs. in 365 days.

In the Dairy Classes, the Canadian Ayrshire Breeders Association and the Holstein-Friesian Association of Canada are offering special prizes for their respective breeds, that will very materially help to enhance the winnings of the successful competitors. The Brayley Drug Co., Ltd., of St. John, offers a silver cup for the six best pure bred dairy animals, any breed, 1 bull and 5 females, fitted on Dr. Wilson's Derby Condition Powders.

The Provincial Bank offers silver cups for the

best judging of sheep and swine by amateurs.

The Canadian Bank of Commerce silver cups for the Grand Champion Ram aud Boar, any breed, 2 years or over.

There are prizes for members of the Boy Breeders Pig Clubs and Boys and Girls Poultry Club members. These sections should interest every farm boy and girl as well as their parents and every effort should be made by them to make these sections the most attractive at the fair by making a full entry.

The War Gardens Association's generous prize should induce the best showing ever made in vegetables at St. John. School garden displays are also encouraged by generous prizes.

Returned men who have beeu doing good work in Fine Arts and Crafts have ample opportunity to display their goods and compete for prizes.

A new feature and one which is most important will be a comprehensive welfare exhibit and a baby show which will be staged by the Public Welfare Department under the auspices of the New Brunswick Department of Health.

Come on September 4th and remain until September 11th is the invitation extended by the management, ask for prize list if interested, and plan early to make a big display fully representative of New Brunswick by doing your share in your little corner for the Provincial Exhibition.

SPRAYING METHODS AND MIXTURES IN THE ANNAPOLIS VALLEY.

A representative of the Farmers' Advocate who recently visitted the Annapolis Valley has gleaned the following information for his progressive journal:

Lime-sulphur Abandoned — Bordeaux Returned to Favor—Dusting Becoming Popular.

Approximately one thousand tons of dust and spray materials will this year be applied to the apple orchards of tne Annapolis Valley, Nova Scotia, in an effort to control the insect pests and fungus diseases that lie in wait to attack the fruit. Last year in the neighborhood of 240 tons only were employed, so it is easy to comprehend the spirit of the people in regard to this one operation connected with the apple-growing business. The Valley is now one huge experimental orchard, where numerous formulas are being investigated and divers methods are under examination. Growers are adopting methods that appeal most to them under their own peculiar circumstances. They are givign some thought to efficiency, but expediency is receiving due consideration. There are so many factors to be considered that one is not safe in jumping at conclusions based on one grower's experience, or the experience of a dozen, but the grouping of one hundred or five hundred orchards gives pretty valuable information—in fact, quite as reliable information as a single experiment conducted with unerring accuracy, but under peculiar seasonal and soil conditions. There are sprayed orchards and dusted orchards; orchards sprayed with lime-sulphur, and orchards sprayed with Bordeaux mixture. There are orchards sprayed with varying strengths of the materials mentioned, but the sentiment among growers seems to be in favor of dusting. In a few hours one can visit growers who advance arguments in favor of oll the methods and mixtures we have mentioned, but throughout the Valley the concensus of opinion is that Bordeaux mixture in a modified form, perhaps, is superior to lime-sulphur as a fungicide, and that dusting is, at least, preferable to spraying. Growers in the Annapolis Valley are massed, so to speak. They see each other frequently, and they take time to talk things over. Under such circumstances the dusting practice naturally made converts very rapidly. Growers were anxious to find something a little more pleasant to apply than Bordeaux, or the still more objectionable lime-sulphur, and when the dust was found to be, at least fairly efficient it was adopted just as speedily as dusters could be obtained. Throughout the month of June engines could be heard throbbing in the orchards before the cock crew in the morning, and in the calm of the evening thin clouds of dust hanging over numerous orchards revealed the fact that dusters were again at work. Dusting is more contagious than any other method of scab or insect control yet devised. This, coupled with the fact that large orchards can be treated speedily. and at the proper time, has resulted in a great many dusters being brought into the Valley, and a large demand that cannot be satisfied.

The Evolution of Spraying.

The first material to be used in the Annapolis Valley was the old 4-4-40 Bordeaux, with Paris green added as an insecticide. This gave good results in the control of scab, but as its use increased the apple crop showed considerable injury in the form of "russeting" or "netting." Bordeaux was adopted slowly at first because growers were not sufficiently convinced that it paid to spray. Old prejudices had to be broken down; new methods had to be established. After the missionary work had been done lime-sulphur was introduced. It was not a pleasant mixture to apply, but it gave very good results as a fungicide, and a clean finish to the fruit which has not yet been surpassed by any other material. Then came power sprayers and the spray gun. In order to do a thorough job, growers drenched their trees with materials put on under great pressure, and the opinion gained ground that the apple crop of the Valley was being sprayed off with lime-sulphur. This induced a swing back to Bordeaux mixture, and almost concurrently with this came the duster. By 1918, the Thompson-Bordeaux, which was a modified mixture used for several years by Mr. Thompson and Mr. Buchanan, near Berwick, came into favor. It was composed of 2 or 3 pounds blue stone to 10 pounds of lime and 40 gallons of water. It could be used on any variety, in all weather conditions, aud at any time without fear of crop reduction. By this time orchards had grown in size with many growers handling all the way from twenty-five to fifty or seventy-five acres of orchard. Even if the duster was not so efficient as the power spraying outfiet, it was believed that far better results could be obtained from the use of dust, because the orchards could be covered at the proper time and the work speedily executed. Probably one-half of the apples produced in the Valley this year will be on dusted trees. Growers have been co-operating in the use of dusters for two reasons: one was to save or keep down initial cost. and the other was that sufficient dusters could not be obtained to go around. One duster would do four or five properties, but this system has not been found satisfactory. Many who had an interest in a duster have purchased outright for themselves, and there are many growers now spraying who will obtain dusters as soon as they can get delivery. The nature and amount of material brought in and distributed this year will give readers some idea of whta is going on in the Valley. The following is a list of materials handled by United Fruit Companies: Hydrated lime, 450 tons; copper sulphate, (bluestone) 44 tons: arsenate of lime, 31 tons; dry arsenate of lead, 8½ tons; sulphur dust. 100 tons; Sanders' dust, 290 tons; soluble sulphur, 4,000 lbs.; tree tanglefoot, 2,400 lbs.; Black Leaf, 2.104 lbs.; lime-sulphur, 31 barrels; dusters, 53; dust mixers, 1. There will probably be in the neighborhood of 100 tons of material and many dusters distributed by agencies other than the United Fruit Companies. The 31 barrels of lime-sulphur and 4,000 lbs. of soluble sulphur, in comparison with the total quantity of spray materials, indicates the popularity of the lime-sulphur spray at present in the Annapolis Valley.

The Lime-Sulphur Controversy.

As previously meutioned, growers have entertained the opinion that they were spraying their apples off with lime-sulphur. This is not the unanimous opinion, however, for it is claimed by some that the pressure under which the lime-sulphur was applied was responsible. George E. Sanders, in charge of the Dominion Entomological Laboratory at Annapolis Royal, stands ready to condemn lime-sulphur unequivocably. He argues that lime-sulphur has at least been partially responsible for the short crops between the years 1911 and 1919. Prior to 1919 the Bordeaux mixture was in general use, and by 1919 the pendulum had swung back in the direction of Bordeaux. He furthermore declares that lime-sulphur injury usually carries over and injures one or more succeeding crops. Experiments conducted by Mr. Sanders lead him to believe that the lime-sulphur injury is not so much a direct damage to the apple as to the proper functioning of the leaves. Experiments have shown him that when lime-sulphur is applied to the leaf that chlorophyl is precipitated, and ability of the leaf to function properly is impaired. The information Mr. Sanders gets from Nek York State also leads him to believe that lime-sulphur will eventually go out of use in that extensive apple-growing district.

Professor W. S. Blair, Superintendent of the Dominoin Experimental Farm at Kentville, has not found in his experiments that the crops sprayed or subsequent crops are influenced as to yield by the application of lime-sulphur when it is properly applied. He does concede, however, that a danger exists of spraying apples off with almost any material when the trees are drenched under heavy pressure. Lime-sulphur must be used with a reasonable amount of care, and while Professor Blair is not advocating that growers persist in the use of lime-sulphur, he is not convinced that apples are sprayed off with it when the work is properly executed.

J. Howe Cox, one of the vice-presidents of the Nova Scotia Fruit Growers' Association, is still loyal to lime-sulphur as a spray. He is careful to see that the nozzle or spray gun is not held too close to the trees, and that a mist rather than a stream of the spray material reaches the foliage and the twigs. He is of the opinion that apples have been sprayed off by high-power sprayers, and that he drop would have resulted even had pure water been used as a spray material. Other growers, interviewed by the writer, are still clinging to the lime-sulphur, but are using it in a very much diulted form. Some have been using, for a summer spray, one gallon of lime-sulphur to ninety of water, but they are increasing the arsenate of lead because it, too, has a high fungicidal value.

The Spray Calendar.

Tre spray calendar prepared for Nova Scotia by George E. Sanders and W. H. Brittain, Provincial Entomologist, recommends the following mixture:

First Spray.—When leaves are about one-quarter of an inch in diameter, use 3-10-40 Bordeaux, and one pounds of arsenate of lime to forty gallons.

Second Spray.—When the blossom buds are showing pink at the tip, use 2-10 40 Bordeaux and one pound arsenate of lime to forty gallons.

Third Spray.—When blossom petals have fallen, use one pound soluble sulphur, five pounds hydrated lime, and one-half pound arsenate of lime to forty gallons of water.

Fourth Spray—Two weeks after the third spray, use 2-10-40 Bordeaux and one pound arsenate of lime to forty gallons of water.

It will be noticed from these recommendations and from the list of materials distributed by the United Fruit Companies that aresnate of lime is rapidly taking the place of arsenate of lead. It is somewhat cheaper and gives good results. Some burning has resulted from arsenate of lime in the past, but not enough to curb the increasing use of it.

Materials Used As Dust.

The dust in most common use this spring was the copper-lime-arsenate dust, which is a mechanical mixture composed of 10 lbs. dehydrated copper sulphate, 85 lbs. hydrated lime, and 5 lbs. arsenate of lime. When this materal strkes the leaf it turns to Bordeaux mixture and assumes the characteristic color of Bordeaux, which it does not have prior to contact with moisture. In this case the Bordeaux is made on the tree rather than in the tank or in the mixer. It was recommended by Mr. Sanders, who originated and has patented the mixture,(that it be applied at the rate of about 50 lbs. per acre each application, for 25-foot trees. Like other dust materials, it should be put on in the morning or evening when the air is still and the foliage of the trees is damp.

Good results are also obtained from the sulphur lead-arsenate dust, or 90-10, as it is usually called. A great deal of this came into the Valley alrcady mixed last year, but the United Fruit Companies are obtaining their sulphur in the States this year and the lead powder in Canada, and mixing it in their own plant. The cleanest orchard in the Annapolis Valley last year was dusted according to the following program: Second dust, 90-10 sulphur-lead-arsenate; third dust, 85-15 sulphur-lead-arsenate; fourth dust, 90-10 sulphur-lead-arsen-

THINNING APPLES IN ORCHARD.

Thinning the fruit in apple orrhards has often been rerommended. To a considerable extent it is practiced in commercial orchards, but it has not been adopted on many farms. The average farmer has failed to do much along this line, partly because of the work which it requires and in part because he has never given the subject careful attention. It is worth while, however, to note some of the advantages which it offers and thus become qualified to jhdge whether it will be wise to adopt it. The benefits will accrue to the tree, the soil and the fruit. The only important objection to the practice is found in its cost.

Proper thinning benefits the fruit by giving the apples room in which to grow to a large size and by allowing them the needed sunlight to bring out their color. It does not materially and, probably in the majority of cases, it does not at all reduce the total quantity of the crop. Overbearing causes the production of small and poorly-colored fruit, while proper thinning promotes the growth of fruit of large size, uniform shape and good color. Where apples are concerned, size, uniformity and color are market assets of great value.

Some growers thin their apples by means of pruning. This is a rapid method and by removing many of the fruit spurs, it prevents overbearing of the trees as a whole, but it does not prevent crowding of the fruit on the branches that remain and its effect upon the trees, both as regards to their appearance and their permanent well being, is likely to be injurious.

What is a much better way is to remove the surplus fruit without cutting out the branches. This can be done by hand the same as when picking ripe apples, or by cutting off the stems with shears. Whatever the method, care must be taken not to injure the fruit spurs. Not more than one or two apples should be left on a spur and none should be allowed to remain on spurs from which fruit is desired the following year. The small varieties may be thinned to stand four or five inches apart, but for the very large kinds, the space should be from seven to ten inches. All wormy and ill-shaped fruit should be removed without regard to its distance from that which is to be saved.

In June, nature does something in the way of thinning fruit. From most trees that are heavily loaded, a good many apples fall to the ground. When this dropping has ceased, and the remaining apples have reached a size of an inch or a little more in diameter, the artificial thinning can be done to good advtantage. Some growers, however, delay this work until August. Such late thinning may prevent the breaking of branches, but it will not conserve the energy of the tree, or prevent a waste of growth, as effectively as earlier work would have done.

There can be no question but that proper thinning of apples on trees which have set too much fruit, will be of great advantage to the grower. Against the benefits of the practice must be placed the cost of doing the work. Some of its advocates claim that it costs little or nothing. They hold that it takes no longer to pick a small apple and throw it away than it would to pick the same apple after it was grown and save it. But as thinning involves going over the tree twice instead of once, it must require more work than leaving all the picking till harvest time. Still, there is no doubt that a part of the time spent in thinning will be regained in harvesting.

Whether it will pay to thin the apples in any given orchard depends on the conditions in that individual case. There cannot be a rule of universal application. The character of the fruit, the age and vigor of the trees, and the probabilities of having a good market for the fruit must all be considered.

It will not be profitable to spend time with varieties which are of poor quality. If they are not good as they now are, they cannot be made good by increasing their size and improving their appearance. When small trees which have recently come into bearing set too much fruit, thinning will tend to keep them from serious and permanent injury, and it will certainly pay. When trees which have been fruitful for 10 or 12 years are over-loaded, thinning at the proper time will be a protection to the trees. and will cause a marked improvement in the appearance and a material increase in the market value of the fruit. Thinning the apples on old trees that overbear will be beneficial to both trees and fruit. J. E. R.

Prince Edward County, Ont.

HOME SEED SELECTION VALUABLE FOR FARMERS.

That farmers will profit by the home selection and production of vegetable seeds is pointed out by J. B. Keil, garden assistant at the Ohio Experimental Station.

Transportation conditions and the supply of vegetable seeds during the past year have been such as to prevent many from getting their usual amount.

With home selection and growing it is possible to secure the best strains of many varieties.

POTATO DUSTING.

By G. E. Sanders.

In the past, dusting potatoes has not been entirely satisfactory for a number of reasons. The material used for dusting has been costly and somewhat inefficient in the control of fungus diseases and the machinery used for applying dust has not been satisfactory. On the whole, the dust has been quite satisfactory in the control of biting insects.

In view of the rapid changes that have taken place in the building of dusting machinery, and the development of dust fungicides that are not only cheaper than the old, but are giving excellent results n the control of fungus diseases of potatoe, dusting seems to hold more promise for the potato grower than ever before.

The dust that is giving the best results as a fungicide on potaoes, is one made up of 15 lbs. of dehydrated copper sulphate. 8 lbs. of arsenate of lime and 77 lbs. of hydrated lime mixed in a mechanical mixture and applied when the leaves are damp with

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

Use Lantic Sugar For All Preserving

Do this for the sake of its purity, its high food value and for its "FINE" Granulation which dissolves instantly and gives you full sweetening power. *Don't take chances on a preserving sugar.* You need pure cane sugar that you can *depend upon.* Ask your grocer for Lantic in the original packages.

2 and 5 lb. cartons. **10, 20, 100 lb. sacks.**

ATLANTIC SUGAR REFINERIES, LIMITED,
MONTREAL

Preserving Labels FREE!

So much preserving is being done this year that time-and-labor-saving devices are particularly welcome to the housewife. We will send without charge to users of Lantic Pure Cane Sugar a convenient book of gummed and printed preserving labels for all of the most popular fruits in exchange for a red ball trademark cut from a Lantic bag or the top panel of a Lantic carton. Write for these neat and handy labels today.

Lantic Sugar

"The Seal of Purity"

dew or after a shower. This dust transfers the making of Bordeaux mixture from the spray tank to the leaf of the plant. To dust a field with this mixture costs more for material than liquid spraying, but it is much less costly than any other dust in the market.

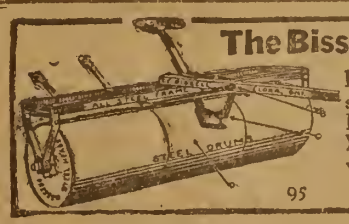
Experiments with the new dust gave excellent results in the control of the potato beetle, arsenic in this form is much more active and kills more rapidly than arsenic in liquid Bordeaux. Control of blight and rot has been better than from any commercial dust, but not quite equal to liquid Bordeaux. As the copper can be still further increased and each increase in the copepr content gives better fungus control, there seems every probability that a fungicide approxiatemly equal to liquid Bordeaux can be made in the form of this new dust. One of the most outstanding features of the new dust is the stimulation that it seems to give. All experimenters last season noted the greater vigor of the tops where the new dust was used over those treated with liquid Bordeaux.

On account of the work of B. R. Coad of the U. S. Bureau of Entomology on cotton, dusting machinery has developed very rapidly during the past three years. There are now two excellent hand dusters or dust guns on the market. One made by the Feeny Company, of Munice, Indiana, and sold by the United Fruit Companies of Nova Scotia, and the Niagara Sprayer Company. The other machine is made by the Tow Lemons Company of Springfield, Tenn. These machines have large capactiy and do excellent work on areas of less than one acre.

There is every promise that the tractions and power dusters that are now being placed on the market by a number of firms, will apply dust to potatoes in a satisfactory manner, which is more than could be said of power and tractions outfits in the past.

The new dust should be applied at the rate of 50 lbs. per acre per application, and the applications should be spaced a little closer together than liquid Bordeaux, as dust is slightly less adhesive than the liquid.

The new dust is not the full equal of liuqid Bordeaux in the control of fungus diseases on the potato, but the general results show it to be only slightly inferior. On killing insects and in stimulating the plants, it is superior to liquid Bordeaux. For the present the new copper arsenic dust is recommended to those who cannot spray on account of the difficulty of hauling water and those who are in such hot sections that the vitality of the plants is lowered by the excessive heat.



The Bissell Steel Roller has a rigid steel frame —no wood whatever. Large roller bearings and strong 2" axles insure durability and great strength. The Bissell is a 3-drum Roller of good weight, built to stand hard usage and give great service. Write Dept. for free catalogue.

DAIRYING.

STUDIES IN MILK SECRETION.

As a part of the work in animal husbandry investigation studies in milk secretion are being made by the Maine Agricultural Experiment Station. Six papers have been published. The seventh paper, Bulletin 281, on the "Transmitting Qualities of Jersey Sires for Milk Yield, Butter-Fat Percentage and Butter-Fat" is now being sent out by the Station. The bulletin contains about 100 pages about equally divided between tables and text. The object of the study is to analyze the progeny performance of the American Jersey Registry of Merit sires so as to ascertain the nature of their transmitting qualities for milk production, butter-fat percentage and butter-fat. The effort has been made to put this whole matter in concrete, easily understandable, numerical terms.

It was found that of the 224 Jersey Registry of Merit sires which met the requirement of the performance test for their transmitting qualities of milk production, 105, or less than one-half, raised the milk production of their daughters over that of the dams of these daughters. Some of these sires stand out pretty eminently in the way they have raised the milk production in their daughters. For instance, Hood Farm Torono 60326 raised the milk production of 34 daughters on the average more than 2600 pounds above their dams.

There are 225 sires in the Jersey Registry of Merit which meet the requirement of the daughter-dam performance test for transmitting qualities of butter-fat percentage. Out of this number, 101 sires raised the butterfat percentage of the dams of these daughters. The leading sire in this butter-fat percentage raised his daughters about 1-13 per cent butter-fat.

There are 224 sires given in the Jersey Registry of Merit of known transmitting ability for net butter-fat. Out of this number only 99 sires raised the butter-fat production of their daughters over that of their dams. The sire which made the deepest impress on the breed by raising the pounds of butter-fat of the largest number of daughters over that of their dams was Hood's Farm Toronto with 34 pairs with an overage increase for each daughter of over 121 pounds of butter-fat.

There were 150 bulls in the Jersey Registry of Merit of which it was possible to find the transmitting qualities for milk production, butter-fat percentage, and butter-fat of Jersey sires to their sons. Of this number 69, or less than one-half had sons who raised the butter-fat production of their daughters over that of the dams.

Sires of superior merit are defined as those who raise the milk production and butter-fat percentage of their daughters as compared with that of their dams, and inferior sires are defined as those who lower the milk production and butter-fat percentage of their daughters as compared with the same variables in their dams. There are 28 sires in the group of sires who are superior in their transmitting qualities of milk production and butter-fat percentage against 47 sires inferior in their transmitting qualities. This difference emphasizes with startling clearness the need of exact knowledge of the transmitting qualities of bulls to be used as sires and the necessity of the exact knowledge for the inheritance of milk production and butter-fat percentage.

Studies of the pedigrees of these two groups of sires disclosed the fact that all the animals which appeared in the pedigrees of the superior sires, on the male's side of the pedigree more than 4 times or on the female's side more than 3 times, had animals which appeared in the pedigrees of the sires that were inferior in their transmitting qualities. This fact alone makes it clear that the appearance of a certain famous animal in the pedigree of a given bull is no guaarnty of that particular bull's work.—By Chas. D. Woods, Director Maine Experiment Station.

CHANGES IN ADVANCED REGISTRY SUGGESTED BY HOLSTEIN BREEDERS

President Aitken, of the American Holstein-Friesian Association, dealt with "Tests and Type in Breeding," in the course of his address before the annual meeting of the association, held at St. Paul, June 2. In regard to the different tests, he said:

"I have read with a great deal of interest the different versions of long-time tests and the advantage of long-time over short-time, but have never seen anything to cause me to change my mind. I am willing to admit that there have been crooks, fakirs, and frauds making short-time records, and I am just as anxious to admit that there have been fakirs and frauds in long-time tests, and if the long-time tests were the most valuable and had the most to do with increasing value of the animals, that would be the place where it would be hardest to watch it; but because there are crooks and because there are fakirs is no reason why the association should bite off its nose to spite its face. The question is, which of these tests is most practical and most beneficial to the Holstein-Friesian breed? My own belief is that they are both essential and necessady, the seven-day and ten-month particularly."

Type in Breeding

Speaking on type in breeding the president said:

"Form and function are co-ordinated in dairy cattle. The vitality and high production of our cattle result from their form and functional development, and these are the results of thousands of years of favorable environment with selective breeding. These things constitute the purebred of today and thus there come to your hands these wonderful instruments, the work of untold generations who have gone before. The type of the pure-bred as so developed should be approached with reverence. No hasty hand should seek to radically alter the type so attained and which is so correctly indicated in our scale of points. But danger there is, and lamentable as may be the fact, that in the hands of most owners a retrograde movement sets in, due to our own carelessness and neglect or perhaps the striving after false ideals.

"Be again reminded that you must ever keep in mind an ideal in your breeding operations which shall ever consist of the true type of the breed, and do not neglect proper and liberal feeding as the essential accompaniment to your efforts.

An Important Resolution

The most important resolution before the convention was brought forward by J. T. Williams, of Illinois. which proposed to have certain radical changes made in the Advanced Registry. It was as follows:

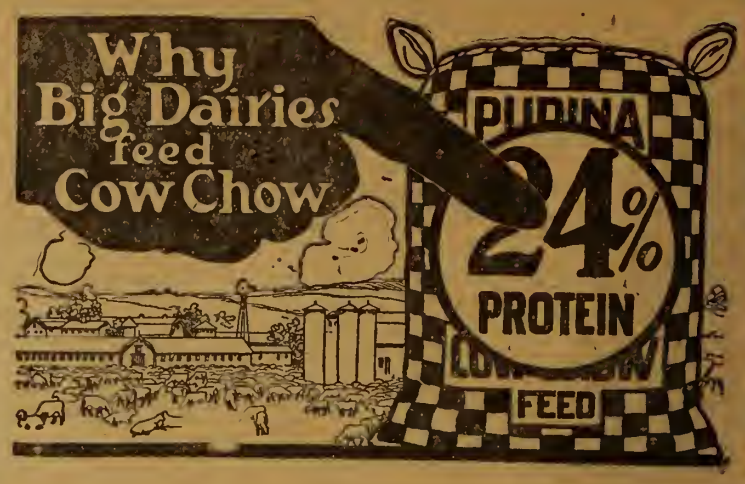
1. The rules of Advanced Registry be changed to prohibit the milking of cows of official test for either short or long-time test more than three times in twenty-four hours except in case a cow on test gives ninety pounds of milk in three milkings in twenty-four hours. It may then be permissible for the cow to be milked four times in twenty-four hours for so long as the cow produces one hundred pounds of milk or more for each twenty-four hours, but as soon as she drop to below one hundred pounds of milk in twenty-four hours, she shall again go back to three times milking in twenty-four hours.

2. That the rules for Advanced Registry for long-time records shall be changed to eliminate, all classes and periods except one period for nine months, 275 days; that the cow making a record for this period must have a fully developed calf within fifteen months from her date of freshening and that for every day she carried her calf over twelve months her record shall be penalized and reduced an amount that will in effect make her record practically equal to a cow that had calved within twelve months. The superintendent of Advanced Registry is hereby instructed to work out a table of reduction or penalties to be subtracted from the record of a cow calving after twelve months from her last freshening but still calving inside of fifteen months. In all cases the record shall be 275 days from the time the cow was started on the record.

3. That the rules of Advanced Registry be changed governing short-time records so that the period of a short-time record shall be ten days instead of seven and that no records for a short-time period be made except ten-day records.

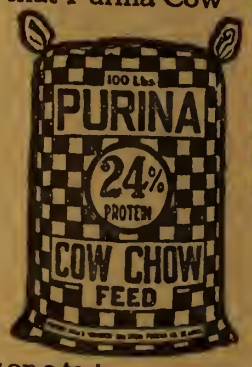
4. To discourage the excessive fitting and the resulting high percentage of fat test that the rules governing both long and short-time test shall be changed so that no cow shall be credited with an average per cent of over 4½ per cent on short-time test or over 4 per cent. on long-time test for the total amount of milk that the cow produces in her test period.

In other words, if a cow on short-



You can understand why Purina Cow Chow has been adopted as the standard ration on the D. W. Field Farms, the Allamuchy Farms, and hundreds of others that head the lists, when you realize that Purina Cow Chow is

24% protein



of which 85% is digestible. This means 20 lbs. of digestible protein in every 100 lb. bag.

It is a pure feed that balances home-grown roughage and reduces the cost of production. More milk from the same number of cows means a larger profit per gallon.

Purina Cow Chow Feed—sold only in checkerboard bags. Let us put your herd on a test.

time test produced 500 pounds of milk on which 500 pounds of milk the average fat test due to excessive fitting was 6 per cent. or 30 pounds of butterfat, this cow for record purposes would only be credited with 4½ per cent. as an average fat test for the 500 pounds of milk or 22½ pounds of butterfat instead of 30 pounds of butterfat as she would now be credited with under the present rules.

It was not the purpose, Mr. Williams said, to have this resolution adopted, but he desired to bring the matter of making records before the members in order to secure their opinions. He was not sure that the wording in his resolution was all that could be desired, but he did hold, and so did most of the members present, that rules and regulations for the making of A. R. O. records could be and ought to be modified and new classes provided. Mr. Williams in commenting upon his resolution said: "Consideration must be given to the man who does not care to milk four times a day and to end the practices which makes a 3.5 per cent. cow test 6 per cent. Young breeders, who are not informed regarding the factors followed to produce abnormal testing milk, are misled and they have purchased bulls from dams having high official testing milk, only to find their progeny producing from 3.2 to 3.7 per cent. milk. Such bulls are sold under false pretenses and the practice should be stopped".

Mr. Hall, of Colorado, held that a cow should be given credit for everything she can make.

Mr. Aiken said: "If a cow has been fitted for a test by a long period of resting she does not represent the Holstein cow. She must be developed to promote the dairy industry; to produce economical food and to dry her up for five or six months to be made fat, defeats that purpose. She must be trained for efficiency and not short spurts. It is the little breeder who keeps the breed alive, for four-fifths of the breeders rely upon milk for income and discard the calf.

Mr. Smith, of the State of Washington, held that we did not have too many measures for the cow. He believes in the seven-day, 30-day, and 305-day tests. They all have a place.

W. F. Schilling suggested that seven-day records should be started 30 days after calving The flow of milk will be larger, but the test lower.

Some one who favored the fattening of cows before testing asked: "Can a board of directors take away the fat which is produced in this way?"

Mr. Hanson, of Iowa, asked: "Do you expect to do away with the seven and 30-day tests?"

Mr. Aitken: "By no means."

It was finally moved and carried that the president appoint a special committee of ten, five to be bona fide milkers of cows, to consider this question and to report their findings and recommendations to the next annual meeting.

BUSINESS SIDE OF DAIRYING.

There is as much business attention required in taking care of the modern dairy herd as there is in the operation of any comemrcial enterprise. Just as a business manager has an inventory of his stock always on hand, the prices and worth of the various products, the date of purchase and the profits expected from sales, so must the owner of a dairy herd keep a record of every individual.

Each cow should wear a number which should be entered in a book. The data to be recorded about each cow will include her age, ancestry, date of purchase, cost, milk record and disposition. It is quite important that the time when a cow is served is noted, so that the calving time may be fairly well determined.

With such a record at his finger tips, the dairyman may with confidence put into effect his advertising scheme. When a buyer comes to look at his stock and sees how faithfully the records are kept, he will be inspired with confidence. When a buyer writes for data concerning one of the herd, the information will be right before the owner. When two or more cows are asked about, the buyer can ascertain something more than the general description which too many dairymen give of their stock. This originality of description has made many a sale possible where other methods have failed.

The selling of surplus stock requires, first of all, honest and faithful advertising. The public must be informed and kept continually supplied with advertising matter if anything more than a local reputation is to be achieved. There are several means of advertising open to the dairyman. The most reliable one is through the medium of the agricultural press.

—Robert McGrath.

CREAM FOAMING IN THE CHURN.

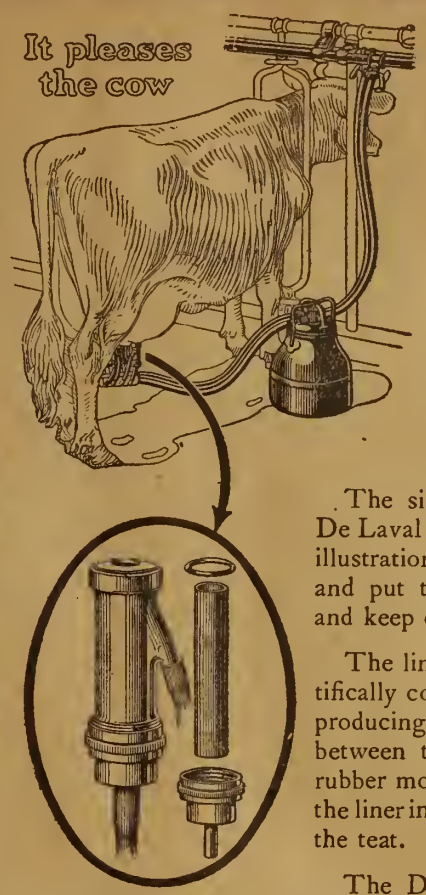
After chruning several hours I find the cream has only turned into a thick foam. I had the temperature 62 degrees when starting. What is the cause? C. C.

Foaming of cream in the churn may be due to too low or too high a temperature, or too long keeping; slow or delayed churning is often accompjanied by foaming.

You do not state whether your cream is separator or gravity cream. Rich separator cream may be churned at from 42 to 52 degrees. Gravity cream requires a temperature of 58 to 65 degrees in summer and 65 to 72 degrees in winter. If your cream is gravity cream foaming in the churn will result if you have kept the cream on the milk too long or have kept the cream too long before it is churned. The cause of it is the formation of alcohol in the milk by the decomposition of the milk sugar, and the combination of the alcohol with the fat and the formation of a soap. When this happens no amount of churning will bring butter.

To prevent this trouble, half a teaspoonful of baking soda may be stirred in the cream, and this should always be done, if you suspect this condition, at least one day before the cream is churned. If the cream is too warm for the particles of butter to unite, foaming will result, and the remedy is reducing temperature by adding cold water; if cream is too cold add warm water, that is, if cream is fresh.

Do not leave it until you are actually in need of a herd or flock leader, before purchasing. Take plenty of time and purchase the best individual available. Remember that he stamps his qualities and many of those of his ancestors upon his progeny. The larger the herd or flock, the more important it is from a financial standpoint that the sire be a good one.



The DE LAVAL MILKER

Simple and Sanitary Teat-cups

The simplicity of construction of the De Laval teat-cups is plainly shown in the illustration. They are easily taken apart and put together, and very easy to clean and keep clean.

The liner is made of pure rubber, scientifically correct in construction and design, producing a massaging action on the teat between the suction periods. A flexible rubber mouthpiece is formed by the top of the liner in such a way that no metal touches the teat.

The De Laval Milker is faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance. It is quickly and easily cleaned, and is used by many dairies in A. R. O. work and where certified milk is produced.

An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

LIVE STOCK.

PRODUCING STEERS FROM DUAL-PURPOSE COWS.

There are many good stockmen who are very skeptical about the possibilities of producing both milk and beef from the one breed of cattle, and they can always advance the argument, and it is a good one, that as the milking proclivities develop the desirable beef conformation recedes into the dairy form.

While inspecting the herd at the Dominion Experimental Farm, at Fredericton, the writer's attention was directed to a particularly good steer about seventeen months old. The animal was straight in his lines, fairly low-set, well covered wtih flesh of good quality, and on the whole presented a breedy appearance. The interesting thing about the young bullock, however, was his ancestry. His grandam was just an ordinary cow showing some Holstein breeding, and was picked up in a back settlement. She was developed into a good milker, giving eight thousand pounds of milk. This cow was mated with a dual-purpose Shorthorn bull and produced a heifer calf, which in due course was bred back to a bull of similar breeding. The steer illustrated herewith was the result of this mating, and the heifer herself gave 7,000 pounds of milk in her first lactation period. When questioned regarding the economy of feeding steers of this breeding, the Superintendent, W. W. Hubbard, stated that two steers similarly bred had been sold March 18, returning a profit of $35 each. At time of sale, they were in the neighborhood of fourteen months of age. One steer weighed 850 pounds and dressed out 493 pounds. They sold for $96 each and cost approximately $61 to rear, leaving a profit of $35.

As calves they were never with their mothers; they were fed new milk until three weeks of age, and then gradually changed to skim-milk. The first real mixture was composed of the following ingredients: oil cake, cornmeal and crushed oats. This was mixed in the proportion of 100 pounds oil cake, 400 pounds of cornmeal and 200 pounds of oats. The steers were calved in January, and the meal mixture during the following winter was made up of wheat bran, 300 lbs.; screenings, 300 lbs.; oats, 200 lbs.; and oil cake, 200 lbs. Besides other roughage they received roots and silage.

The history of these steers shows conclusively that a herd can be moulded, to a large degree, in two or three generations. If one desired to breed for milk, there is plenty of evidence pointing to the fact that the milk flow can be increased and the butter-fat content of the milk influenced considerably. So it is with beef. Ordinary grade herds can be bred up to a point of excellent through the use of proper sires. The milk-and-beef combniation is a little more difficult to attain, but through keen observation and close attention to matings it is evident that a compromise can be accomplished. Good sires, if properly selected, will give the desired results.

FEED WELL BUT DO NOT BREED SOW TOO YOUNG.

Many farmers are not particularly enthusiastic about hog raising at the present time. While the market is treble what is was a few years ago, it is not commensurate with the price of feed and labor. Many brood sows have been marketed during the past six months, but, on the other hand, many have kept young sows and bred thm for fall farrowing. Others are planning on breeding their sows to farrow early in the spring, so that the pigs will summer on grass and be fattened with next year's crop. The success in pig raising depends a good deal upon the feeder. One man may bring a litter along and have the pigs at 200 pounds or over when six months old, while his neighbor with the same breed and the same kind of feed requires from seven to eight months to get his hogs to the same weight. Wrerein lies the difference, if not in the feeder? A good deal of the trouble is in failure to pay attention to details. Giving the pigs a liberal quantity of feed is not enough. A person must be careful to neither over-feed or under-feed. The ration must be studied and the kind and quality of feed given that the pigs will do best on. Feeds containing plenty of protein and ash are essential during the first four or five months of the pig's life; after that feeds rich in carbohydrates and fat may be fed in abundance. Skim-milk is one of the best feeds for young pigs, but it is not available on many farms. Finely-ground oats, a little oil cake, a few shorts and milk make an ideal ration. Many pigs do well without the milk, but they should not be weaned quite so early.

Anxious to get returns quickly, there is a tendency to breed the young sows before they have acquired their growth. This is a big mistake, and the sow seldom turns out as well as when she attains her growth before farrowing. The best young sows should be saved from the litter and given every chance for development before they are bred. It is not a good plan to have a sow farrow before she is a year old, and some breeders like to have them older. This gives the breeding stock a chance to attain good size, and the offspring are usually stronger and more uniform in size than those from an undeveloped sow.

If the litter is large, few sows will give sufficient milk to satisfy the young pigs; consequently it is a good plan to encourage the pigs to take milk from the trough when they are a couple of weeks old. When milk is not avilable, finely-ground oats, shorts, oil cake or a little tankage can be made into a thin slop with water and will materially aid the pigs in developing size. Care must be taken to keep within the appetite of the pigs. This requires that the feeder pay strict attention to his work. It seems as if the producer is not in a position to dictate the price of hogs, so the next best thing is to raise the hogs as cheaply as possible. The size and thriftiness of the litter is one thing which materially influences cost. Where posible, pasture or green feed should be used as this will reduce the grain allowance considerably, and is good for the pigs. A half-starved litter will not make 200-lb. hogs at six months, and on over-fed litter is liable to die of thumps, apoplexy, etc. It is necessary to steer an even course and satisfy the pig's appetite without overdoing it.

GOOD TASTE IN THE SHOW RING.

Every exhibitor of live stock to be successful must be a sport around fair time. The rank and file of those who have devoted their time to breeding and exhibiting live stock are good winners and good losers. The compliment of being a good winner or a good loser is even better than that of being a good breeder or good exhibitor of stock. To be a good winner or loser is a virtue that builds friendship, loyalty, admiration and love.

Some men cannot even win gracefully, and when it comes to losing, chains and bull staffs would not protect them against themselves.

Achievement is a fine thing. Every man worth while has ambitions in this direction. Using the show ring as an illustration, everyone cannot win blue and purple ribbons, because there is only one available in each class. The exhibitor blessed with true sportsmanship recognizes this. If he wins he curbs his egotism, and if he loses he curbs his temper. Such men are builders of the greatest of all things—good fellowship.

There have always been a few fellows, however, and they are still to be found at every show, large or small, that do not recognize that others have rights equal to theirs. Such fellows always know beyond a shadow of a doubt that no one else has animals that even compare with theirs. Before the judging they are boastful about what they are going to win, and after the judging—if they do win—they are overbearing and their sole attempt seems to be to humiliate the less fortunate ones. On the other hand, if they fail to win they are grasped by the bitterness of a ruined disposition. The whole world is wrong. They rant and the things they say about their fellow exhibitors and the judge are unprintable and if they were true the enrag-

103

ed exhibitor would be about the only one outside of prison bars.

Such fellows lack the elements of good sportsmanship. As a rule they lack knowledge, also, for it is the rule that they stand alone in the opinions they posses and express. It is the rule that the consensus of opinion is that such fellows should learn; they should learn about cattle, learn how to gracefully win or lose as fate designs; they should learn much about sportsmanship.

This does not imply that judges are infallible; not by a long way. Judges are but human beings and all human beings make mistakes. Frequently exhibitors know more about their cattle than does the judge. So it should be. A good breeder, living and working with his cattle winters and summers, should know all about them. Good judges know this, respect the fact and are always glad to discuss in sportsmanlike manner all decisions that time will permit. Knowledge for both exhibitor and judge is the result of such a policy.

But, when circumscribed thinking, careless speaking, suspicious exhibitors ignore the right of others, ignore common sense and good ethics and resort to scandalizing their fellow exhibitors and judges by depicting imaginary deep laid plots that have been prearranged to place ribbons where they do not belong, it is time for fair and show officials to step in and call a halt.

Good sportsmanship is the first principle of good exhibitors, good judges and good shows. Without good sportsmanship there can be no good exhibitors, no good judges, no good shows. To be a man and gracefully win or lose as justice compels is better, by far, than to be either than a man and win all of the prizes at all of the shows.

LOSE LIVE STOCK FROM CARELESS POISON USE.

The danger of animals becoming poisoned through the careless use of poison material when spraying or pating for insects, is pointed out by officials at the Ohio Experimental Station, Wooster.

Every year reports are sent in of animals suddenly dying from securing access to paint boxes and poison containers.

Sometimes Pairs green boxes, white lead or arsenate of lead containers are thrown into the trash pile or dump and animals get the poison from these.

Paint boxes, even though thinly coated, are licked by cattle because of the sweetish taste of the lead compounds.

Such boxes should be thoroughly cleaned with gasoline before using for farm pails, it is stated.

Materials most dangerous to live stock are Paris green, London purple, arsenate of lead, calcium arsenate, and any compounds of arsenic or zinc.—Weekly Press Bulletin.

According to information furnished by the Industrial and Development Council of the Canadian Meat Packers, 864,000 head of farm stock were handled at the six main stock yards of the Dominion up to June 30 of this year. They comprised 283,765 cattle, 135,387 calves, 91,957 sheep and 254,784 hogs. Almost half this number of cattle and hogs were handled at Toronto, with Calgary leading in sheep.

Have you visited some good stockmen and farmers in your neighboring county. or taken a trip to the Agricultural College or Experimental Farm this summer? A couple of days spent motoring through the country and having a look over some good herds not only rests a person from his every-day duties, but gives an inspiration to do better work on the home place.

THE HORSE

HORSE DISEASES OF THE RESPIRATORY ORGANS.

Broken Wind, Pulmatory Emphysenia Heaves.

The term "Pulmonary Emphysenia" implies that condition in which some of the inspired air escapes from the air cells into the lung tissue. Some authorities claim that this condition exists in all cases of "broken wind" or "heaves". It is a non-inflammatory disease, characterized by difficult breathing; the inspiration movement is performed with ease, the expiratory with apparent effort. The difficulty in breathing in well-established cases is constant, but varies greatly in intensity acording to existing conditions. A peculiar cough, called "the broken wind cough," is generally more or less well marked, and many affected animals are subject to indigestion and flatulence from slight causes.

Many causes of the disease have been given by various writers, but it is now, generally conceded to be a "Dietetic Disease," due to improper feed, more particularly to bad, musty or dirty, or corase hay containing a large quantity of practically indigestible or woody fibre as a consequence of being too ripe when cut, and to a super-abundant allowance of hay of any kind. In most cases where an investigation reveals the actual facts it will be found that the patient has habitually had the opportunity of overloading the stomach, in many cases with coarse indigestible feed. The average horse will eat too much bulky feed if opoprtunity offers; many horses are practically gluttons. If the feed be of good quality and the animal's digestive power is good, no evil may result, but if the feed be of poor quality or digestion weak and the habit of overloading the stomach be continued for a long time, heaves is often the result. Observation teaches us that a large percentage of horses that suffer from heaves are abnormally heavy feeders. There are some exceptions in which cases the cause probably has been a weakness of the digestive organ. The stomach and the lungs are largely supplied with nerves by branches from the same nerve, called the "Pneumogastric." The theory of the cause of heaves is that overloading the stomach causes an irritation to the nerves of the organ, which, by sympathy is transferred to the pulmonary branches of the nerve of supply, and that this being more or less regularly repeated for continued length of time, causes a rupture of the walls of some of the air cells, uniting two or more into one, hence allowing some of the air to escape into the lung tissue. The history of a horse that is affected with teh disease tends to confirm this theory in many cases.

Symptoms.—Respiration is more or less labored, according to the development of the disease. The inspiratory movement is performed with ease, but the expiratory by two apparent efforts, at the conclusion of which the muscles relax and the flanks fall. Observation will reveal the fact that the expiratory movement is accompanied by a double movement of the muscles of the flank. There is usually a characteristic cough which appears to be ejeculated with a sort of grunt, through the upper part of the windpipe. In well-marked cases the cough is frequently accompanied by forcible expulsion of faeces per rectum. The double flank movement is more or less well-marked according to the development of the disease, but is present in all cases. If te theory as reregard to reupture of the walls of the air-cells be correct, we can readily understand why difficulty is experienced in expelling the air from the lungs, as the natural recoil of the cells has been removed by rupture, hence compression of the lungs is necessary to expell the air. This is accomplished by contraction of the diaphragm and the abdominal muscles, hence the secondary flank movement, the first, or normal one having failed. In some casese there is a nasal discharge, but this is by no means a constant symptom. The degree of inspiratory effort is always more marked when the stomach is full, and is greatly influenced by the condition of the atmosphere, being much more marked in dull weather than when the atmosphere is clear. Rapid or severe exercise increases the symptoms in all cases. The characteristic cough is readily recognized by those who have given the disease much consideration. In suspicious cases, where the symptoms are ont well-marked, the horseman often causes the horse to cough by pressure exerted upon the larynx, in order to observe the nature of the cough. It is hard to understand why climate and atmospheric conditions have so marked effect upon the condition. In some cases where the symptoms are well-marked, and

the animal removed to a different climate, it is noticed that after a few months the symptoms practically disappear. In many cases there appears to be a pre-disposition to indigestion and flatulence and veterinarians have noticed that an attack of indigestion in a heavy horse is much more seroius than one of like violence in one whose lungs are healthy.

Treatment. — Preventive treatment consists in feeding carefuly on feed of good quality. Even with feed of good quality an unlimited supply of a bulky nature tends to cause the disease, especially in horses that are predisposed on account of voracious appetties or other causes.

As regards curative treatment it can readily be understood that if our theory be correct, a cure cannot be effected, as it is not possible to reform the walls of the air cells. The symptoms can be lessened by careful feeding. All feeds should be of first-class quality; bulky feed should be given in small quantities, in order to not over-load the stomach, and if necessary the quantity of grain increased. Cares must be taken to not allow the animal to over-load the stomach, and, if possible, even after a moderate meal, to allow an hour or two to elapse before putting the animale to work or drive. The dampening all feed with limewater gives good results. The administration of medicines has no curative action, but the symptoms may be palliated by all methods that improve indigestion, and by remedies that give tone to the digestive organs, as gentian, ginger and nux vomica in dram doses of each three times daily.

Horse traders resort to various methods for relieving the respirations of broken-winded horses. They know that they breathe moderately well when the stomach is empty, and that certain drugs that have a sedative effect temporarily lessen the symptoms. Hence when they expect an opportunity to dispose of an affected horse they take care to keep him short of both feed and water, dose him, and give him a sharp trot to encourage him to unload the bowels before showing him to a prospective victim, who discovers, when too late, how cleverly he has himself been "sold."—Farmer's Advocate.

Stiffness

It is astonishing how quickly Minard's Liniment relieves stiffness and lameness.

Gives Great Relief

Mrs. A. R. Calcott, 26 Park Ave., Guelph, Ont., writes—"My husband has used Minard's Liniment frequently, always with good results. Friends of mine use it for rheumatism and tell me that it gives great relief."

Mrs. Fred Johnston, Box 735, Thorold, Ont.—"I suffered very much with neuralgia in my face last winter, was advised to try Minard's Liniment, and was relieved immediately after first application. I persevered in using it and it has entirely gone. This winter I can go out without tying up my face and give the credit to Minard's Liniment. Have told several people about Minard's, and others are using it."

NO MARKET FOR THE NONDESCRIPT HORSE

As the season draws near, some farmers are beginning to think about breeding their mares, while others are considering the purchase of stallions.

My opinion of the horse market is that the breeder of good sound draft horses has a bright future ahead of him, and the man breeding nondescript horses is exceedingly dull. There was a time in the West that any kind of a horse sold at a profit, but that day is gone.

In proof of the above statement you can go to any centre where horses are sold in any quantity and see the demand for good draft horses, particularly well-mated teams, and the drug of scrub horses on sale that go begging.

There are several reasons why horses have not sold for higher prices than what are being paid. The first and main reason is the scarcity of good stallions in the country The reason for this is the low service fee.

The man who buys a good stallion at a long price simply cannot make a paying proposition out of it at fees anywhere from $10 to $20 with the guarantee of a standing foal in some cases, and no foal no pay in all cases, brought under the writer's notice. We have proved the above claim by actual experience in handling stallions.

There is only one way of making the purchase of a high-class stallion a profitable undertaking, and that is that the man himself owns enough good mares to raise a good bunch of foals every year. The man that has ambition enough to bring a good horse into a district deserves the support of his neighbors and should be remunerated enough to warrant a reasonable interest on his investment. In this way, if the horse is prepotent to get matched teams of the much-prized type of drafter it will not be long before buyers get wise where they can secure matched teams and will pay handsome prices for them.

When a farmer can raise a pair of good geldings and sell them from $350 to $500, why won't it pay? Do they eat any more than inferior stuff? I think not. Another reason is that farmers as a whole do too much cross breeding. Now when the man with a Clyde or Percheron mare will breed to anything from Hackney or Standard Bred horse to Belgian stallions, what will the harvest be? Not much uniformity. I have seen fine cross-bred horses, but what about the next cross? If he is going to continue breeding horses he will never get anywhere, yet it is too often done. If you have good draft mares, whatever breed they may be, choose a stallion of the same breed and stay with the breed and with the same stallion if he is a good breeder.

The demand for draft horses in Europe is beyond conception of the average farmer in Canada and there are two reasons why they have not purchased more horses in Canada. The first is that they simply haven't the money to buy them, and the second reason is that we haven't got the class of horse they want, and they will raise as many themselves as possible and we will lose a valuable export trade that would be a boon to any country.

We have enough faith in the future of the horse that we will breed our mares this coming season. The high prices of a few years back will surely come again.

And now for the last reason. Some people thought the tractor would displace horses on the farm and the motor truck in the city. I am not prepared to answer about the city, but on the farm they can only act as auxiliary power to the horse. I notice a great number of tractors in our country, but very few operating owing to crop failures, the owners using what horses they had. That goes to prove that the horse is the cheapest and most reliable power on the farm. In conclusion I would say breed your good mares to a good stallion of the same breed and little you should worry about the prices in a few years. A. G.

PARTRIDGE TIRES

Game as Their Name

The cost of horse labor would be reduced by raising colts from the brood mares and selling them before they wear out on the farm. Too many farmers hang on to their horses until they become too old for service other than on the land. Let others stand the loss of depreciation.

Owing to the coolness of the weather during seeding, trouble from sore shoulders was not so pronounced as it might have been had warm weather prevailed. Horses' shoulders have had an opportunity to become hardened, but as hot weather arrives the danger will increase. Lift the collar occasionally while the horse is in harness, and when the team goes to the stable bathe the shoulders with cold water.

Joint-ills exact a heavy toll each spring, but much of the loss can be prevented by taking the necessary precautions.

POULTRY.

FEEDING FOR EGG PRODUCTION.

The question of feed is the hardest one to solve this year because practically all feeds are high. It will pay to feed the pullets well from the start, though the hens might be fed more lightly till the middle of January. Where possible, use feeds grown on the farm. Good wheat screenings, shrunken wheat, barley, oats, or buckwheat all make a multitude of feeds and cut down the cost. If these can be fed, animal feeds such as beef-scrap may be curtailed or dispensed with. High-priced mashes may be eliminated and cheaper ground feeds such as bran substituted. Two or more of the grains may be mixed in equal proportions for the grain rations. The mash may consist of ground barley and oats, or bran may be added. If grain has to be purchased, cracked corn is as cheap as anything and makes a suitable addition to any grain ration. Bran is as cheap as one can buy for the mash.

The mash can be fed dry in a hopper or mixed with milk and fed moist once a day. Any table scraps should be used in the mash. If milk is not available, beef scrap or other animal food should be fed in the mash. In a good, heavy litter, feed a mixture of the grain ration morning and night, allowing the hens sufficient grain so that they will always have some in the litter, but not so much that they can get a crop full without scratching for it. In the prairie provinces there is considerable shrunken wheat available. Shrunken wheat, if it is dry, is as good a poultry food as wheat fit for milling purposes. Care must be taken that it is not damp or otherwise spoiled. Shrunken wheat alone, if there is no other grain, will answer for the grain feed. For the mash, use bran, middlings or chopped seeds, make a good feed for either grain mash. If alfalfa or clover can be had, by all means give the leaves to the hens.

In every case, grit and shell should be before the layers at all times. In some localities the grit can be secured from the local gravel pit and in other cases sufficient lime can be secured to do without the commercial shell. If neither of these is available they should be procured and as much given to the birds as they will eat.

It does not pay to stint the layers. If they do not get the feed they will not lay the eggs. As a rule, a laying hen will not get too fat. Therefore, feed the pullets well. If green cut bone is available and there is no milk, the former may be fed to the pullets at the rate of about an ounce each per day. The proportion of grain and mash usually eaten is from two to four of grain to one of mash.—F. C. E.

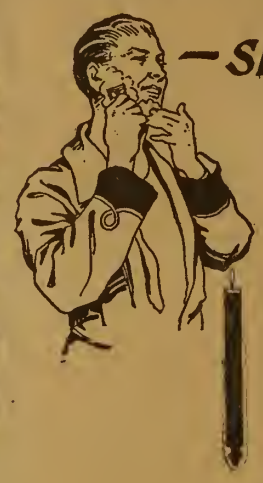
TO BREAK UP A BROODY HEN.

One of the sidelights of egg-laying competitions has revealed the fact to a greater degree than is generally known at the average farm, that broodiness with the hens entered lost them more than a month during the laying year. Therefore it is well to recognize that broodiness is one of the big factors in keeping down the egg production of the average farm flock during the spring and summer months.

Broodiness can be understood and controlled better if we first understand the tendencies and habits of the domestic hen and also the process of formation of eggs that goes on inside the hen's body. Nature must have known that the spring of the year was the best time to hatch and rear chicks, and so arranged that the primitive hen laid one or more clutches of eggs at that time and brooded them. Man, seeing the possibilities of using these eggs for food, has continually selected and bred hens that lay for longer periods and has now obtained some individuals that lay throughout practically the whole year. However, the birds still retain some of their original tendencies. Each hen tends to lay in regular order, according to what is called a cycle, which is a series of days during which the hen lays.

This cycle of production varies considerably even in individuals, but a hen will generally follow this cycle of production except for intervals of rest. Heavy producing hens have long cycles of production that are repeated

AutoStrop Razor
—sharpens itself



Edge Before Stropping (Magnified)
Edge After Stropping (Magnified)

A CLEAN start for the day! Out of your bed and shaved in three minutes. This is AutoStrop Razor service.

Easily stropped, easily cleaned—nothing to take apart or unscrew. The only safety razor that sharpens itself. Your travelling equipment is not complete without an AutoStrop Razor.

Any dealer will gladly demonstrate the AutoStrop Razor to you, guarantee satisfaction, or refund purchase price.

Only $5.00—complete with strop—twelve blades in an attractive assortment of cases to suit any purpose.

DO NOT DISMISS CONSTIPATION AS A TRIFLE. IT IS NOT.

Half the ills of life are caused by allowing the bowels to become constipated.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick and bilious headaches, sourness of the stomach, biliousness, heartburn, water brash, or the painful, irritating internal bleeding or protruding piles.

Keep your bowels regular with Milburn's Laxa-Liver Pills and you need never be constipated.

Mrs. C. Henderson, Trail, B.C., writes:—"I have been troubled with sick headaches and constipation most all my life. Have not now been troubled for a long time. I have great faith in Milburn's Laxa-Liver Pills since using them."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

frequently with only a small intervening rest period. In the spring of the year it is during this rest period, after having completed one or more cycles, that a hen tends to become broody and wants to hatch out the eggs she has laid. She is merely answering nature's call of reproduction.

When a hen first becomes broody, her physical condition is the same as that of a hen that is laying right along. The ovaries contain several partially formed yokes. These yokes are formed by layers of yolk material that are put on around the small ova (or eggs) that are present in the bird's body even before hatching. These layers of yolk are put on only when the hen has some extra food material that her system does not need for other purposes. In other words, egg production occurs only after the hen has supplied all of her body needs. So, when a broody hen does not leave the nest to feed, she has to maintain her body with her reserve food supply. The result is that these partially formed yolks are taken back into the system and used for body maintenance. This means that before a hen can again come into a laying condition she will have to feed for build these yolks to normal size so that they can be used in the formation of the egg.

Other changes occur in the body of the bird. The pelvic bones curve close together. The abdomen shrinks and the capacity decreases. The comb and wattles become shrunken and scaly. All these conditions indicate that the bird's system is not being properly nourished for egg production. There even seems to be a mental change, for after a hen has been broody for a week she is very stubborn about being broken up and put back to work. Understanding these various tendencies and changes we can see the importance of attempting to prevent this broodiness when it is first noticed.

The method used most successfully in avoiding broodiness is to make a trip of inspection through the poultry house every afternoon after four o'clock and catch all hens on the nests. Laying hens have completed their work and left the nests by this time. These broody hens should be shut up in a coop.

Sometimes efforts to prevent broodiness are directed along the wrong lines. The importance of gathering up the broody hens every day must not be overlooked. The longer we wait to break up a broody hen the more difficult it becomes and the more time is lost. It is not to our advantage to mistreat a bird merely because she follows a natural tendency. By giving the birds a water bath or by starving them, we are merely causing a greater loss in egg yield. Plenty of feed and good care under the proper conditions are all that is necessary to break up a broody hen. And until the domestic fowl loses her tendency to hatch her own eggs we will have this same problem of broodiness to contend with.—A. W. H. in Ottawa Valley Journal.

RID POULTRY FLOCKS OF PESTS.

Most flocks need special attention during the moulting period to save the birds from serious annoyance if not actual harm from poultry parasites.

Hens infested with lice will not lay as many eggs nor produce as many pounds of flesh as those kept free from parasites. Care in keeping the flock clean will prevent waste of feed and reduction of profit.

During the moulting period many hens do not "dust" and the new feathers furnish an abundant supply of food. The lice will injure the new feathers.

While a few lice on the body do not cause the hen any great injury, their feet have sharp claws, and they have sharp mouth parts that inflict painful wounds by gnawing the skin. In extreme cases the lice have gnawed till a large wound was caused, sometimes killing the bird and often causing her to loose flesh rapidly.

Although there are several kinds of poultry lice all can be killed by the same treatment. On mature fowls, the lice, or their eggs, can be found between the feathers of the fluff, and soft feathers about the thighs and rear part of the body, on the under side of the long wing feathers, on top of the headfi, or among the feathers on the side of the thighs. The careful poultryman gets the habit of looking continually for lice.

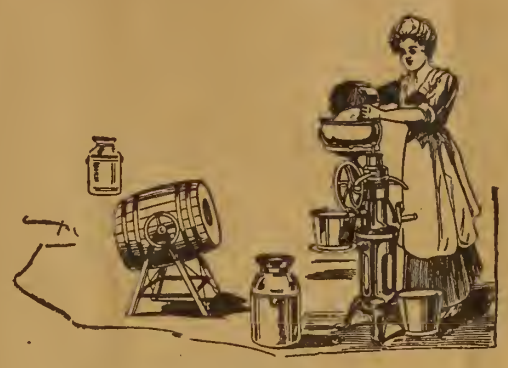
Massey-Harris



The Features that Give Superiority to the Massey-Harris Cream Separator

THE Superiority of the Massey-Harris Cream Separator consists in getting more of the cream at all temperatures than is usually the case, and in getting a better cream, for it gets the very fine globules which are so rich in butter fat, and which produce butter with a better flavor and keeping qualities.

The features which make this possible are the improved Split Wing with its *Six* V-shaped openings which spread the whole milk uniformily over each and every disc, thus utilizing the entire skimming area: the large skimming area, and the absence of conflicting currents of skim and cream once separated.

Send for our Special Cream Separator Folder.

Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

To love one's friends, to bathe in life's sunshine, to preserve a right mental attitude—the perceptive attitude, the attitude of gratitude—and to do one's work—these made up the ideal life.—Elbert Hubbard.

THAT TRIP TO CALIFORNIA

"ANNA!" Karin's high pitched, excited voice followed the banging of the apartment door. "Oh, Anna, the most wonderful thing! Think of it. Jane is going to California!"

The older sister, hastily depositing the packages obtained in the six o'clock rush hour and then putting in the potatoes to boil before even removing her hat, looked up with faint interest. She was very tired and her feet were swollen. Her daily occupation allowed her little or no time to sit down and every evening was the hurry to get dinner. Then after dinner the clearing away—Karin was popular and usually had an engagement—followed by a bit of washing or a few pieces to iron and always something to mend, her clothes and shoes to brush and then to bed. She was ready for it at eight o'clock, but it was usually 11 or 12 before she had nished the many household duties. She had to at six to put the little apartment in order before they left for the office, and Karin always got up at the latest minute. Anna was nearly always dreadfully tired, but Karin loved the little home and heartily detested boarding house meals. To Anna any meal she would not have to stand and prepare would be delicious.

"Anna," shrilled Karin, her cheeks like rosy satin, "Jane asked me if I wouldn't come along for three months. And I have the money, you know. I have $800 saved. It will be enough, or nearly enough, anyway."

Anna put down the paring knife. "Karin, spend every last penny? And how about your position? Will Mr. Lee hold it for you that long?"

"Oh, don't throw a wet blanket! I have the money in the bank, and if it does tave every cent I can earn more. Mr. Lee will hold my position open till I get back. Oh, Anna, think of it. California! Anl I've longed and longed to see it! If I haven't quite enough you will lend me a little, won't you; just a hundred dollars?"

Anna nodded gravely. Instantly Karin wound her warm young arms around the older girl's neck. "Darling Anna, you can't imagine how happy I am! It's been my biggest wish for years and years. In three weeks it will come true!" She ran off singing to change her dress. A few moments later she threw herself on the davenport with pencil and paper to make up a list of needed travelling things while she waited for dinner.

"Anna," she called to the kitchen, "I'm going to economize on clothes. Just a few good things. I'll buy a suit, and I have those two dress patterns Aunt Lu sent. I'd save a lot if I wouldn't need a dressmaker; they're so hard to get anyway. Say, Anna, are you listening? You sew so beautifully, do you think you could finish the two in three weeks?"

But Anna, just putting the chops in sizzling fat, did not answer. Her back ached and the very thought of dressmaking made it hurt more. To get the dresses done would mean forfeiting every evening and all Saturday, if not Sunday.

At the dinner table Karin repeated her question. "Of course, I'll help, Anna!" she pleaded. And the older sister promised.

By sitting up every night till one o'clock sewing, Anna finished the two dresses in ten days. She wished to save herself the nervous tension of sewing in the last few days. Besides, Karin was depending on her for the packing. It was a great relief to think the dressmaking was over. Karin had not been able to help very much with the sewing. And there had been one or two parties given for her and Jane.

It was 5.30 and at last Anna could close up her desk. There had been more work than usual. She felt actually dizzy and her temples thumped alarmingly. Perhaps Karin will wash the dishes tonight, she reasoned dully as she stumbled into the street, and I'll go to bed right after dinner. She realized that she was unable to cook a warm meal and she stopped at a delicatessen store for some cold victuals. The place was crowded, but she braced herself against a barrel of olives, regardless of her serge suit. It prevented her sinking to the sawdust floor.

At last she was in front of the apartment house. The two flights of stairs seemed like mountains to climb. She sat down on the first step of the second flight to gather strength, too wabbly to undertake it all in one effort. Slowly she made her way up. Oh, well, tomorrow was Saturday and right after lunch she would lie down, she thought. The usual Saturday afternoon cleaning must stay undone. Maybe Karin—oh, no, she was going on a final shopping tour with Jane.

She flung herself, hat and all, across Karin's white bed, waiting for strength to come to get supper. It was a blessing that she was late tonight. Anna made a great effort and rose. Somehow she got into a bungalow apron and set the table as usual.

"Oh, Anna," sang a fresh, lovely voice, "I've brouhgt home company for dinner."

The older sister stood aghast. The chilly pink ham on the platter and the ready-made potato salad, and company for dinner! She began to rummage frantically in the cupboard to find a can of soup.

"Oh, Anna it's Jane, and I hope you've something extra good, for we're hungry as two bears!"

Anna still had her head in the cupboard. What was the matter she could not seem to see.

"Anna, look!" Karin was in the kitchen at the table.

Anna turned, grasping the back of a chair for support. Karin laid a package on the table and was cutting the string. "Do you think you could manage it, Anna darling? Just a simple little affair for afternoon." And she held up shimmering folds of flowered organdy. But there was a frightened cry from Karin's lips. "Jane, Jane, quick! Anna has fainted!"

Later that same night a woman physician beckened Karin out in the hall. The young girl raised a white, frightened face. "It is overwork, lack of sleep and recreation. It is not a nervous breakdown. From what I can understand, she has been doing the work of two. In her condition she is liable to pick up anything—'flu' germs or typhoid. She would not have the strength to pull through." Karin suppressed a little cry of terror. "A complete change of living is what she needs, but what she will get is probably a few days in bed and then back to the old routine. Good-night."

But then and there a fierce little resolve took root in Karin's heart. Lying upon her bed, her lips moved for help. "Help me to choose the right words that will convince her that she must go with Jane to California!"

The next morning, after telephoning their respective firms of their absence, Karin stepped softly into the little bedroom. Anna looked up with a wan little smile. "Poor baby sister, don't look so unhappy, dear. I'll be as well as ever Monday morning. You won't have to postpone your trip, though I guess you'd better see a dressmaker about that organdy."

Karin dropped on her knees beside the bed and hid a wet face on Anna's shoulder. "I've been a wicked, selfish pig, and I don't even deserve a sister like you. And—and I'm not going to California. You are going with Jane!"

Anna laughed weakly. "You dear little silly thing. Do you really think I could take your trip? Do you think I'd enjoy one minute of your trip, Karin? I would not dream of it. You are going, dear, and that is all there is to it."

"No, no," protested the younger sister stubbornly. "You are going."

Anna, too weak to argue, shook her head faintly and fell into a light doze.

In the evening after office hours came Jane, genuinely concerned. She laid a bunch of flaming carnations in Anna's hands and a dozen fresh country eggs on the table. "You are going to get well very quickly," she announced breezily.

"Because," interrupted Karin quickly, "she is going with you, Jane, to California!"

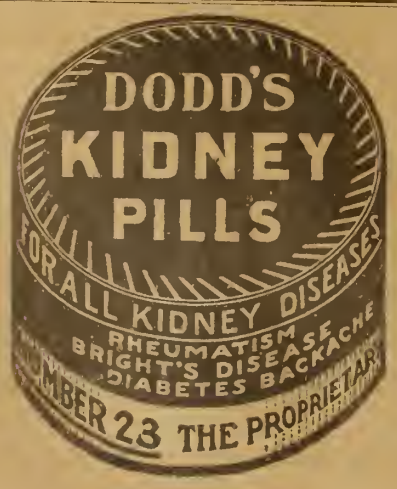
Anna raised two troubled eyes to Jane Bateman for help. "I don't want to go, truly. It would distress me to take Karin's trip."

Jane laid a comforting hand on the thin, trembling one. "Of course, you wouldn't enjoy it. I can understand that, Anna." The latter breathed relieved while Karin's eyes protested. "Now, children, stop quarrelling and listen to me. I'm not going to California myself. You see, the more Karin and I planned the more expensive the trip grew, and I could not quite see where all the money was coming from. It made me uncomfortable to draw out my last dollar for a pleasure trip. But I do think I deserve a vacation, and this is my plan." She drew out of her bag a lot of little pamphlets. "We are so near New York, why not take a steamer all the way to New Orleans, and I know of an old-fashioned place there where we can stay for a week or two. Now, it won't cost us half of a Calfornia trip, and then all three of us can go!"

Karin's eyes shone like stars of a clear night. "O-oh! I think it would be just lovely! A steamer trip and New Orleans! Anna, you can't refuse this! We three together. Won't it be wonderful?"

A little pink color came to Anna's cheeks as she glanced breathless from one to the other.

"You'll be strong enough," mentioned Jane encouragingly, "and on the steamer we will tuck you in on a boat chair and there you may sit for hours and look at the ocean."



MAGIC BAKING POWDER

Contains no alum

We unhesitatingly recommend Magic Baking Powder as being the best and purest baking powder possible to produce. It possesses elements of food that have to do the building up of brain and nerve matter and is absolutely free from alum or other injurious substitutes.

"Jane." Anna sat right up in bed, her eyes bright and devy. "I believe that I just can't wait till we are on that boat!"

"And everything you need," declared Jane firmly, "will be bought ready-made."

"Furthermore," arranged Karin, "while I do the packing you will be on the davenport and just order and direct. And when we come back we are going to Jane's boarding house. Those two second-storey rooms will be free soon, won't they Jane? Then you arrange with Mrs. Murray to hold them for us."

"But——" began Anna.

"No buts at all," laughed her sister. "We will be just as comfy over there. Jane seems to thrive wonderfully upon Mrs. Murray's cooking, an it is much nearer your office, Anna."

Anna leaned back in the pillows, a delightful, lazy, happy feeling spreading over her body. She closed her eyes sleepily, just awake enough to feel Karin's lips brush against her cheek.

WHEN WE DINE

Formal Serving Adds to the Enjoyment of the Day's Best Meal

The usual family dinner consists of either three or four courses, with or without coffee after the dessert.

Soup, meat, salad and dessert are the four substantial courses of a dinner, and most families do not add any more except under special conditions. Many people prefer only three courses, omitting in turn salad, dessert or soup, for variety.

Whether the dinner is at midday or

Far more effective than Sticky Fly Catchers. Clean to handle. Sold by Druggists and Grocers everywhere.

PIMPLES and BOILS

For Nearly Two Years.

When pimples and boils appear on the face and body it seems as if the skin is the seat of the trouble. but the real disease is in the blood.

Lotions and ointments may allay the trouble for a while, but seldom if ever cure.

You have to get under the skin; get at the blood which is the cause of the trouble.

Burdock Blood Bitters goes direct to the root of the disease and restores healthy, normal action to the different organs, and cleanses the blood of all its impurities.

Mr. E. C. Goodwin, Cambridge, N.B., writes:—"For nearly two years I suffered from boils and pimples on my face and neck, and nearly all of my body was covered with the pimples. I tried most everything, but got no relief. One day a friend advised me to try Burdock Blood Bitters, and after using three bottles the boils and pimples had all left me and there is no sign of them returning. I can strongly recommend B.B.B. to anyone who is troubled with skin disease."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

night, the invariable rule for linen is a plain white cloth and large napkins. Underneath the cloth a strip of felt or thick Canton flannel protedts the table and improves the looks of the finest cloth.

The table-cloth should be put on with the greatest care, the crease being straight down the exact middle of the table, and the two ends at equal distance from the floor.

Placing the Flat Silver

In the middle, on a round linen or lace centrepiece, place a low bowl of flowers or a plant. Then allow a space twenty-two inches or more wide by fourteen or fifteen from the edge of the table for each cover or place, and set it with the necessary dishes and silver.

A large-sized dinner-plate is used, with a dinner-knife, the sharp edge of the knife being turned toward the plate, at the right, and a dinner-fork, tines up, at the left.

At the right of the knife place a soup-spoon, which may be of dessert

Speaks Right Out and to the Point

MISS LADERONT SAYS DODD'S KIDNEY PILLS HELPED HER KIDNEY DISEASE.

Bigwood Lady Points the Way to Health to the Weak, Weary, Nervous, Run-down Women of Canada.

Bigwood, Ont., Aug. 1st.—(Special)—"Dodd's oKdney Pills relieved me of kidney disease."

That is the statement of Miss Laurance Laderont, a highly esteemed lady living here. It is short and to the point. There can be no misunderstanding of its meaning. It is a clear and ringing message to women all over Canada. It tells them where they, too, may find relief.

For ninety per cent. of the ills from which women suffer come from weak or diseased kidneys. They are the organs that strain all the impurities, all the seeds of disease out of the blood. If they fail in this work the impurities remain in the blood and are deposited all over the body. The results show themselves in weakness, weariness, nervousness, headaches, backache, dropsy and rheumatism.

Ask your neighbor if all these diseases cannot be avoided by using Dodd's Kidney Pills to strengthen the kidneys.

place the smaller fork for salad, or for dessert if that demands one. The oyster-fork, if such is needed, goes on the side with the spoons.

Coffee-spoons may be laid on the cloth or passed when the time comes, as is the case with dessert-spoons. All the silver is laid with ends about half an inch from the edge of the table.

Near the point of the dinner-knife put the tumbler or goblet for water, and next it, to the left, an individual salt-cellar. To the left of the forks lay the napkin, of large size, exquisitely laundered, and if butter is not served with the meal, put a piece of bread under the top fold, which is turned back.

Butter Not Always Served

This question of butter at dinner is one in which convention wars with personal preference. Most people care enough about it to disregard form in this respect except at formal dinners. If it is used, then the bread-and-butter plate, with a piece of bread, a ball of butter, and a small knife or "spreader," is put above the points of the forks.

When there is no maid an extra supply of bread, and also of butter, may be left on the table, but it is better not to put them there until after the soup course.

The chief thought to bear in mind while serving dinner is that until dessert is reached no person shall be left without a plate in front of him. When the soup-plates are brought in, on flat plates, the original place-plates, which may be large ornamental ones or ordinary dinner-plates, are taken away.

The quickest way to serve the soup in this manner is to bring in two plates at once from the kitchen, leave one on the side table and place the other in front of the first person to be served, taking up the place-plate and returning with it to the side table. From there take the second plate of soup and deposit it in its proper place, putting the place-plate on the side table and returning to the kitchen for a further supply.

A simpler but less conventional method is to bring in the soup-plates, two at a time, without under-plates, and put them on the original place-plates. When any dish is handed to a person, this done from the right side, but when a person helps himself, the dish is presented at the left.

Sometimes small plain crackers are served with the soup, in which case they are placed on the bread-and-butter plates or passed after the soup is served. More often the bread that is already at the places is considered sufficient.

When the meat course is brought in, the plates are changed in the same way as in the first course, a portion of meat being on each plate.

Some people prefer to serve the meat at the table, in which case the soup-plates must all be taken away before the roast is brought in and set in front of the carver. He must have a pile of dinner-plates in front of him unless there is a maid to hand them to him one at a time.

The vegetables are passed (at the left) for each one to help himself, then the bread and the jelly or pickle, both of which may be left on the table.

The Salad Question

The salad, if served with the main course, is put on a plate larger than a bread-and-butter plate at the left of each plate. This may be prepared in the kitchen and brought to each place, or the plates may be passed and the salad served at each person's left, from a large bowl or platter.

When it comprises a separate course, as the more elaborate salads do, the plates are prepared in the kitchen and brought in, two at a time, in the way described for the soup. Simple crackers are served with this, sometimes spread with cheese.

Before the dessert the table is carefully cleared, all bread-and-butter plates, as well as general dishes, removed from the table, and crumbs size, table size, or one with a round bowl. At the left of the dinner-fork

333—Full split Gun pattern, four-inch imitation leather cuff.

300—Gun pattern, horsehide palm, thumb and strap, cuff and back of split, outseam reinforced cuff.

NO matter what your job may be—driving, firing, farming, motoring, or railroading—you'll find your size and your style of Work Gloves in the Carhartt line. Although Carhartt Gloves are good looking, do not forget that they are made to work with. Cut out of fine leather, shaped to the hand, and with strongly sewn seams, they take all kinds of punishment without flinching. The specially prepared leather offers a sturdy resistance against inclement weather, steam and dry warmth. You'll like Carhartt Work Gloves because they're dependable. Their ability to give long wear makes their purchase a distinct economy. They are easily identified by the Car-heart label.

CARHARTT GLOVES

brushed with a clean napkin on to a plate. The glasses are also filled.

Dessert may be served by the hostess, or may be brought in from the kitchen, with the necessary spoon or fork on the plate, if it was not laid on the table at the beginning of the meal.

If coffee is desired, it is brought to each person in tiny cups accompanied by a tiny spoon, and the sugar and cream are passed. Finger-bowls, on doily-covered plates, are brought to each person.

In case the dessert is served at the table the doily and bowl may be removed and the plate used. It is often so used for nuts, or crackers and cheese with the coffee.

Such a dinner is more simple for the family than it sounds, for the house-mother can evolve an easy way to serve it in this way, even without a maid, especially if she has a tea-wagon or "silent Susan."

CREAMED PINEAPPLE

Unlike peaches pineapple does not suggest cream; yet nothing in the way of a sweet concoction is more delicious than creamed pineapple, if properly prepared.

For the dish to be at its best, the fresh fruit is essential. Peel and grate fine one medium-sized ripe pineapple; then to the pulp thus obtained add the juice of one lemon—which, by the way, is an essential addition to pineapple, no matter in what form it is served. It develops latent flavor in the fruit in addition to imparting piquancy to it.

Have ready half a box of gelatine dissolved in cold water. Strain into the fruit and sweeten to taste. Turn into a mold that has been rinsed out with cold water, and stand on ice to congeal partly. Meanwhile dry whip a pint of rich cream. When the fruit and gelatin mixture begins to thicken, fold in the cream and return to the ice to become firm. Remold, and serve with cream and sugar.

A more simple but most tempting pineapple cream dish is made by slicing pineapple very thin, sweetening to taste and garnishing with whipped cream heaped high in the centre like a mound. Decorate with rings made by cutting marshino cherries round and round.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

RID POULTRY FLOCKS OF PESTS.

(Continued from page 809.)

There are four general ways of killing the pests. One is by dusting with insect powder or by making it possible for the bird frequently to take dust baths. This suffocates the lice or knocks them off the body. The best way of applying powder is to place the hen in a tub on her side and then fill her feathers with powder. Care must be taken that no powder gets into the eyes.

Liquid louse paints of which there are several on the market are good. When applied to walls and coop fixtures, their fumes kill the lice. If the chickens are shut in tightly closed houses when the paints are used, the fumes will kill them too, so care must be used.

Blue ointment rubbed on the short feathers just below the vent has been used to good advantage. This kills the eggs of the lice as well as the mature lice. It can be diluted with vaseline.

Axel grease can be applied in the same manner as the blue ointment, and in more liberal quantities, but it is not so effective. The ointment and the commercial dips are not suitable for young chicks. When dipping fowls, grasp them by the legs and then slowly dip them tail first into the solution, being careful to guard the eyes. Squeeze the dip out of the feathers over a draining board and then release the chickens.

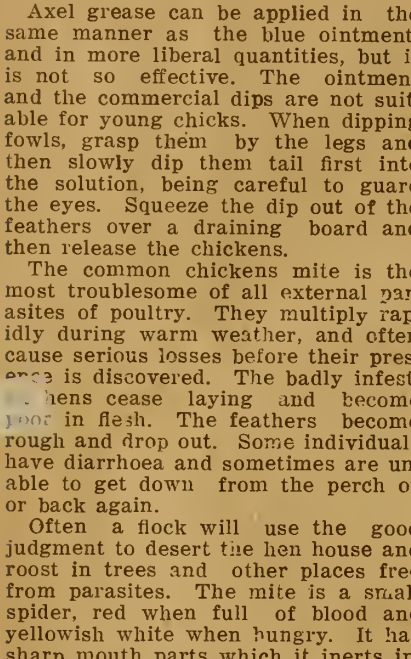
The common chickens mite is the most troublesome of all external parasites of poultry. They multiply rapidly during warm weather, and often cause serious losses before their presence is discovered. The badly infested hens cease laying and become poor in flesh. The feathers become rough and drop out. Some individuals have diarrhoea and sometimes are unable to get down from the perch or or back again.

Often a flock will use the good judgment to desert the hen house and roost in trees and other places free from parasites. The mite is a small spider, red when full of blood and yellowish white when hungry. It has sharp mouth parts which it inerts into the fowl's flesh to obtain blood. It does not stay on the hen during the day but is found hidedn about the hen house in cracks and crevices in the perches, the walls and in the nests.

A little kerosene poured into the crevices will usually cause the pests to swarm out, and when none is seen in a casual search it is well to test for them by this means.

Treatment consists either of fumigating with the house tightly closed or of spraying. After all the litter and filth is removed, close all doors and windows and burn two or three pounds of sulphur in a large dish which stands in a larger dish containing water. Let is burn several hours and be careful that the house is aired thoroughly before the hens return.

Spraying as a rule is more satisfac- liberal application is worked into the tory. Ahe most common sprays are whitewash, kerosen, crude oil, coal tar disinfectants or carbolic acid. A liberal application os worked into the cracks and crevices, the bottoms of the nests, the walls and all hiding places.



SPRAYING METHODS AND MIXTURES IN THE ANNAPOLIS VALLEY

(Continued from page 799)

ate. The dusted Gravensteins in this orchard showed only 9.64 per cent. of scab, while the untreated shewed 97.5 per cent. Many growers used the Sanders dust this season for all except the aplication just after the petals had fallen. For this they used the 90-10 or sulphur dust to prevent russeting. The sulphur dust is not so pleasant to handle as the other, and growers are gradually eliminating it on that account.

Dusting vs. Spraying.

The one big advantage the dusting method has over spraying is that as much orchard can be dusted in one hour as can be sprayed in a day. The dusting is done in the morning and evening when the air is still and the foliage damp. This leaves the best part of the day for other work, such as cultivation or ordinary farm work. Many are dusting because their orchards are so large that they cannot spray them properly and at the right time. In regard to expense an orchard can be treated with the copper-lime-arsenate dust more cheaply than the four applications recommended in spray calendar can be put on. The sulphur dust will cost five or six dollars more than the liquid spray. This, of course, takes time and labor into consideration, for the dust itself costs more than the spray materials. The greats aving is in labor.

Special emphasis in this article has been placed on dusting, for the reason that it appears to be the coming practice in the Annapolis Valley. One-half or more of the growers are still spraying, and many will, no doubt, continue to spray for years. The size of the orchards will compel more growers, from time to time, to adopt the dust even if they still believe that spraying materials properly applied are more effective.

To toughen horses' shoulders, a solution of half an ounce of tannic or gallic acid to the gallon of water will do, although it may be made a little stronger if desired. A solution of half an ounce of powdered alum to the quart of cold water also is excellent for toughening the skin. In our opinion, however, the necessity of toughening is questionable if the collars fit and are kept clean and smooth, provded the parts rubbed by the harness are bathed two or three times daily with soft, cold water containing a heaping teaspoonful of salt to the pint. Some use stronger salt solution and that possibly is correct when the skin is irritated. When the skin is broken do not use the salt solution. A suitable soluton for application to such wounds and all surface sores and cuts is made by mixing one ounce of acetate of lard and six drams of sulphate of zinc n a pint of soft water. It should be shaken well before using. Label the bottle "poison."

ST. JOHN EXHIBITION

THE PROPOSED PUBLIC HEALTH EXHIBIT

Public Health Exhibits have been attempted to a greater or less degree in the Maritime Provinces at various times, but it has remained for the St. John Exhibition to make this a distinctive and complete feature. At the coming Exhibition to be held from September 4 to 11, there will be a Department devoted to a very comprehensive exhibit of this kind. This will be under the auspices of the New Brunswick Department of Health and will have the assistance of a large number of societies whose objects include work along philanthropical or public welfare lines, such as the Canadian Red Cross, Victorian Order of Nurses, Ambulance Association, Play Grounds Association, and many other similar bodies. It is proposed that the entire Exhibit comprise some twenty booths, each dealing with one phrase of the subject. It is also proposed to run a baby show for one or two days, and doubtless there will be much competition for the prizes offered in this connection; possibly also some heart burning among the different mothers wrose offspring fail to qualify for first place. It can hardly be doubted that an exhibit of this nature with its great educational value will prove a tremendous attraction to people in all parts of these provinces.

ABSORBINE
TRADE MARK REG.U.S.PAT. OFF.

will reduce inflamed, swollen Joints, Sprains, Bruises, Soft Bunches; Heals Boils, Poll Evil, Quittor, Fistula and infected sores quickly, as it is a positive antiseptic and germicide. ANNOUNCING THE SAMSON TRACTOR

WHAT THE SAMSON DOES

DRAW BAR

—will pull a two or three bottom plow.
—will pull a tandem disc harrow.
—will pull two 20-ft. spike-tooth harrows.
—will pull two four-horse grain drills.
—will pull two 7 ft. binders.
—will pull large road grader or do any other heavy-duty draw-bar job.

BELT POWER

—will handle any heavy-duty belt-power job.
—will run a 22 to 24 inch grain separator.
—will run a 4 to 6 hole corn sheller.
—will run a heavy buzz saw.
—will run a heavy-duty grinder or ensilage cutter up to 14"
—will run a centrifugal water pump for irrigation purposes.
—will handle stone crusher or large concrete mixer
—will handle large hay balers, and, in fact will do any belt-power job requiring steady, reliable power within the range of the machine from morning till night.

POWER FARMING WITH THE SAMSON

The Samson Tractor is a product of General Motors, makers of such well known cars as the McLaughlin, Cadillac, Chevrolet, Oldsmobile, G. M. C. Trucks, etc.

The Samson is the last word in modern down-to-the-minute Tractor construction—a close coupled power unit from radiator to rear wheels.

The Samson will take the place of a barn full of horses. It has no lost motion for it is built and lubricated like a high-priced automobile. The even distribution of weight, compact unit design, and low center of gravity give the Samson great stability, making it hug the ground and preventing all danger of rearing up and tipping over.

The Samson Model "M" is the one tractor you should look at before you buy a Tractor of any make or kind.

The Samson line includes Tractors, Farm Implements, Motor Trucks and every device for power farming.

The Samson Model "M" will be at the Toronto Exhibition.

Butter Parchment at Farmer Offiec

The cattle's feet should be examined occasionally. If the toes are too long they should be cut beack so as to prevent breaking. When they break it is often too close to the quick, and as a result the animal goes lame for a considerable time. A pair of nippers will remove the toes, or an old hand sam can be used to advantage.

Don't forget that cattle and sheep require a considerable amount of salt, and that they want it at regular intervals. In some dairy herds the flow of milk is materially decreased when salt is neglected. In the case of beef animals it is reasonable to expect that they will not make as good gains where the amount of salt is limited as where it is fed regularly.

A bran mash on Saturday night in place of the full grain ration is a good thing for the horse that is being heavily grained.

Elmwood Stock Farm

We have a few young bulls to offer, sired by Dutchland Colantha Sir Rag Apple, a son of Colantha Johanna Lad. His dam is a granddaughter of Pontiac Korndyke. Thus combining the blood of two of the greatest bulls the world has ever seen.

The dams are daughters of Dutchland Pieterje Count. These calves are a nice straight growthy lot.

500 CHEVIOT SHEEP FOR SALE

Consisting of 300 Breeding Ewes and 200 Lambs.

This flock located on the south shore N. S. has been bred up from native shore ewes and pure bred Cheviot rams until most of them now have only a sixteenth of blood not Cheviot. They pasture in the open, unhoused, upon the abundant feed of the headland ranges and barrens, summer and winter, requiring help in the way of rough hay only and that only on rare occasions when deep snow remains on the ground for any length of time. Among them are many exceptionally fine hardy breeding ewes and from the lambs of this year excellent service rams can be selected. The purchaser by arrangement can have nutil January 1st, 1922, to remove them with free use meanwhile of the ranges, houses and necessary equipment. If purchased for slaughter, beginning with yearlings now ready for market, the whole flock will be in condition upon pasturage alone to market before next January, except a few backward lambs which either will do for feeders to be disposed of during the winter or may be left over to market next year.

For further particulars and inspection inquire of

W. A. KINNEY
Port Monton, Queens Co., Nova Scotia.
July 20th, 1920.

Willow Glen Shorthorns !

FOR SALE

Two yearling Guernsey bulls, well grown, and good pedigree, $50 each. Two yearling heifers, very promising. Two young cows, four and five years old. These cows are good in every way and due to freshen in a month or six weeks. A splendid heifer calf. All registered Guernseys.

SARAH E. M. SMITH,

Woodwards Cove, Grand Manan, N. B.

AYRSHIRE CATTLE. KARAKULE-ARABI SHEEP

We are offering two Ayrshire Bulls, ages 9 and 14 months. They are from big producing dams. Prices very moderate.

We are also offering Karakule-Arabi rams and ewes, producers of the finest Persian Lamb Fur.

For particulars and prices write

THE EASTERN KARAKULE-ARABI SHEEP CO., LTD. WINDSOR, N. S.

FOR SALE

We have to offer a nice bunch of Shorthorn bulls and heifers ages 1 to 3 years.

Also span 4 year old horses, span 5 year old horses span of brood mares and a choice driver

For further particulars apply to

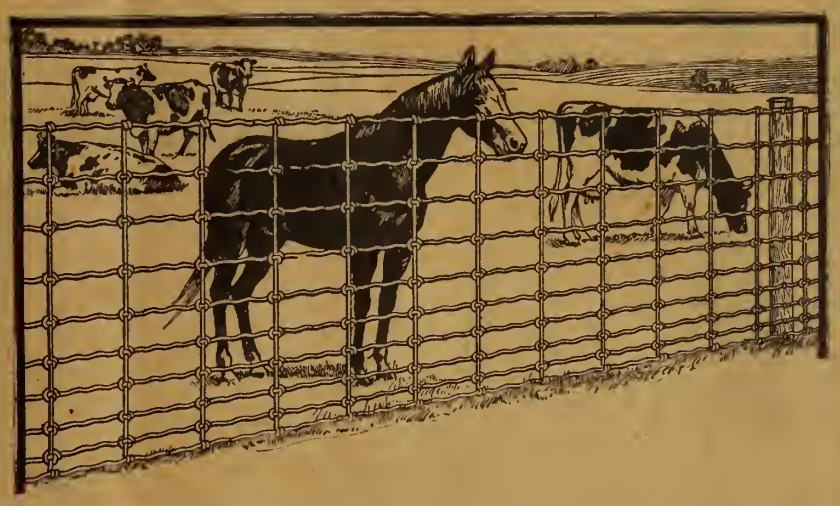
Maritime Fences

Stand the Strain of Man, Beast and Weather

The Maritime Fence is made of extra heavy, hard drawn steel wire of 9 gauge. Each Fence is rigidly tested in our factory, so we know that they have more strength than they are ever likely to need.

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime fence is far longer---and it's wear value much greater.

On the extra quality wire we put a smooth, even, heavy coat of galvanizing.



We put on more than enough, so that the greatest strains of time and weather will not impair it. We lock laterals and upright wire rigidly, yet springily with a cross leverage lock that simply cannot let go under the hardest strain. The superior stretching power of No. 9 wire keeps the strands from snapping in the severest frosts.

A Maritime fence is of lasting strength, sightly appearance, and is a necessary improvement on all Canadian farms.

For sale by agents and dealers in nearly every section.

Safe Water for the Dairy

Orin Crooker, Illinois in Hoard's Dairyman

Water that is not entirely safe for drinking purposes is not safe for use in the dairy. It must be quite above suspicion. To some persons it may appear that we assume in these statements a woeful lack of intelligence on the part of dairymen. This, however, is by no means the point. The average dairyman is as well versed in such matters, no doubt, as the average individual. Possibly he is more so. On the other hand, it is a fact that there is very little real understanding on the part of people generally in regard to what constitutes a safe drinking water. In this regard dairymen are in fully as much need as others of more knowledge. Too often the basis of judgment is the taste or appearance of the water. If it is cool, clear, without odor or disagreeable taste it is usually termed good and safe to use. These factors, however, may have little or nothing to do with its purity or impurity. Furthermore, people accustomed to drink all the time from the same well are poor judges of the taste or odor of the water in question. Our purpose in this article is to state what constitutes a safe drinking water and to indicate some of the more common factors which cause water to fall below this standard of fitness.

Briefly told, water that is free from sewage or other waste products is a safe water to use so far as human health is concerned. It is worth while, in passing to note that a water may be free from such contamination and still possess taste or odor, or both, as is the case with many of the waters from so-called mineral springs. It may be free from sewage and still be highly colored, as in the instance of certain water supplies in New England where the coloring is due to causes that are entirely harmless. On the other hand, water may bubble clear, cool, and sparkling from a spring, yet notwithstanding its attractiveness it may contain sewage or other waste products. Let us, first of all, set to one side any notion we may have that the taste, appearance, or ordor is any sure index of its quality.

It is not surprising, perhaps, that many farm water supplies are not above suspicion. Every farm owner is his own health commissioner, so to speak, and in most cases he acts in this capacity without any training or experience. City water supplies are safeguarded by men especially trained for this work. Not so on the farm. The well is sunk or dug as a rule, in the most convenient spot, often with complete disregard of its surroundings. Little heed or attention may be given to sources of possible contamination. It is common enough to find the well curbing broken or insufficeint. All told, it should be looked upon as a fortunate circumstance, perhaps, that farm waters are as good as they are.

On the assumption that a safe drinking water is one that is free from sewage or other wastes let us now group together the more common sources of such contamination.

(1) Underground seepage from privy vaults, barnyards, hog pens, cesspools, and so on.

(2) Foreign material entering the well through broken or insufficient curbings. Such include the droppings from poultry and farm animals permitted access to the vicinity of the well, leachings from mud and filth left around the well by the feet of those who have visited the barnyard, hog pen ,and so on. Many small creatures, such as mice, toads, snakes, and even rabbits, have found their way into wells equipped with poor curbing.

(3) Slop water thrown upon the ground from the kitchen door or discharged from the kitchen sink into a broken drain may influence quite readily the water of a well that lies within easy dsitance.

(4) To the factors indicated above should be added this additional one, namely, that when water is piped from a spring located on the farm it is not unusual to find it influenced by the droppings of stock permitted to run in close proximity to the point where the spring rises to the surface of the ground.

In each of these instances, save the third, it will be seen that the chief factor of contamination is human or animal excrement, which we cover by the term "sewage." The possible contamination set forth under the third heading is of an uncertain kind which may or may not carry disease producing germs. It is, however, undesirable at best, and should be classed with the others as factors to be guarded against.

Looking back at this point over the four divisions into which we have classified, roughly, the sources of contamination most easily possible in farm water supplies, we are impressed with the fact that most of them can be easily obviated. Indeed, all of them, if need be, may be eliminated in some instances without unnecessary hardship. The source of possible pollution indicated in the third division needs nothing, for instance, to remove the menace it holds save a tight tile or drain and a discontinuance of a disagreeable practice which some farm housewives follow in the manner of emptying their dishpans. Where the ground has become thoroughly impregnated from kitchen slop water the effect of it, of course, will remain for a long time.

In much the same way other factors may be minimized or overcome. A proper curbing over the top and for six feet underground around the sides of the well, will keep out foreign material indicated under the second heading. The fencing off of stock, and smaller applications of manure in the neighborhood of a spring will do much to overcome the situation spoken of under heading four. There remain, then, as sources of possible contamination which may not be so easily remedied, those first enumerated. The location of the privy or cesspool vaults may be changed, but even so the ground in the vicinity of the old vaults will be highly charged with impurities and will so remain for a long period of time. The relocation of barnyard and hog pen may be impracticable or at best attended with difficulties. If such be the case, the only way out, if it is found that the water supply is unsafe, will be through a deep driven well. Ordinarily, the factors of which we have been speaking do not have much influence on a driven well which picks up its water from a deep level, save in instances where the well casing or its joints are imperfect, or where there are faults in the geologic formation which extend to considerable depths. In one southern city a public well over a thousand feet deep had to be abandoned because of surface contamination which found its way to this depth through faults and crevices in the rocks.

After this resume of possible sources of contamination of water supply with sewage and waste, one is interested to know how the ordinary dairyman may assure himself that the water from his well is safe to use. In most instances—indeed in all instances where absolute certainty is desirable—an analysis and examination by a competent person is essential. There are, however, several way in which an approximate idea may be gathered by any farmer in regard to the state of his water supply. If his well is the dug variety he should consider, first of all, the likelihood of seepage from barnyard, privy vault, and so on. He should look at the matter candidly—having in mind the general contour of the surroondings with the understanding that the area of infection may include a circle drawn around the well, the radius of which circle may vary from one to several times the depth of the well.

While lack of taste, odor, and color in waters from dug wells is no indication of purity, the presence of such is a pretty reliable sign that everything is not right. Indications of this kind point to the necessity of an analysis. If the well is a driven one, turbitity or roiliness should be regarded as a signaling for attention, though it is possible for such to come from harmless causes. However, driven wells often leak water from points and corroded surfaces and surface contamination may work in. If the leak is bad it may perhaps be detected by placing the ear against the pump, or it may be seen in some cases by throwing a beam of light down the inside of the casing by means of a mirror. With leaky casings that admit contamination the pipes must be replaced by new ones, save where the trouble lies so near the surface that it can be remedied by the use of cement. Odors and tastes in deep well waters are as a rule less to be feared than those in shallower wells. Water from a depth is apt to be more highly charged with minerals and dissolved gases. The pipe which brings it up from below not infrequently imparts a slight iron taste.

A water analysis will cost, perhaps, from $15 to $25, depending upon how thorough it is and the standing of the person who makes it. The value of such an analysis is in direct proportion to the knowledge and experience of the one who makes it and interprets it. It is possible to tell many things by a determination of this kind. First of all the presence of sewage can be determined with accuracy. It is possible to tell whether the water has received its dose of impurity from a nearby source or from a point considerably removed both as to space and time. It is possible ,also, to distinguish in most cases whether the sewage content comes from the privy or the barnyard. How all this is done would be too technical to explain in this article, but as a matter of general interest it may be said that a thorough examination of water takes account of the presence or nonpresence of the colon bacillus. This is an organism that inhabits the intestinal tract, or part of it, of both man and the farm animals. This bacillus occurs in very great numbers, therefore, in all human excrement and in the usual farm wastes. If it is found in a water supply it is positive evidence that "sewage" has found its way into it. Whether the sewage is of human or animal origin may be determined with fair accuracy by other factors. Human exrement carries more chlorine than that of animals. The slop water from the kitchen sink is also high in chlorine. Where the amount of chlorine in water is high and there appears no slop water influence from the kitchen drain it is a reasonable inference that the privy valut or the cesspool, if there is such, is responsible in part, if not wholly.

The approximate source from which the contamination comes—both in point of distance and recentness—can be inferred from the resutls of the several chemical tests which are made. It is quite possible for sewage contamination to be picked up by ground water at some distance from the farm, or it may be the result of a direct seepage from vaults or barn surroundings. With an analysis before him a person skilled and experienced in such things can tell approximately the situation without visiting the location. If any doubt exists an

(Continued on page 836.)

Notes From the Nova Scotia Agricultural College

N. S. POULTRY MAKING GREAT RECORD.

A summary is given below of the results to date in the first Nova Scotia Egg-Laying Contest at the Agricultural College. It is in no sense by way of boast that it is given, but in order to demonstrated to Nova Scotia poultry men what a good thing they have in the laying strains here being tested, and to the casual keeper of a flock of hens what possibilities are within his reach.

The average egg production of the Nova Scotia hen is 80 eggs per year. In the period running from November 1st to August 6th, the hens in this contest produced an average of 133.5 per hen. Out of the 150 birds in the contest 54 have laid over 150 eggs each. Five hens have reached the splendid total of over 200 eggs each.

The conditions under which these birds are working are good, but in no sense so special that they cannot be duplicated on thousands of farms, or by any industrious poultry keeper. The margin between the average hen and these is very wide, and means all the difference between an unprofitable and a highly profitable line of work:

CHANGE IN COURSES AT THE N. S. A. C.

Beginning with November next, two regular courses will be offered at the Nova Scotia Agricultural College. The first will be a two years' course very similar to the one heretofore given, but in this two year course more attention will be given to so-called practical subjects, and less to the more purely scientific subjects. All boys and young men who have had a reasonable amount of farm experience will be admitted to this course, irrespective of previous school training. In a word, this is to be a Farmer's Course.

The other will be called the Four Years' Course, although many who take it may only complete the two years' course, which is all that in the meantime will be given at the Nova Scotia College. The remaining two years may be obtained at any Agricultural College in America which offers a four years' course. The only students who will be admitted to this course are those who have university matriculation standing in general education.

Students completing this second course will be admitted without examination to the third year at Guelph, MacDonald, or any other Canadian or American Agricultural College.

For the information of the general public it may be stated that heretofore these two courses were conducted as one, and while the arrangement worked out fairly satisfactorily, yet students who only planned to take two years, and then take up farming, felt that they did not get as much practical instruction as they would like. On the other hand they were called on to devote more time than they wished to purely scientific subjects.

Students, however, who wished to continue to the degree of B. Sc. A., felt that they were being held back too much in class work by those who had not sufficient general education before entering the classes.

It is confidently expected that the new arrangement will meet the wishes and needs of both classes of students This same arrangement will this year be put in force both at the Agricultural College at Guelph and at MacDonald College, Quebec.

"NEXT YEAR I'LL—"

Each season, in fact each month, brings home to the alert farmer some lesson. If these are not recorded, however, they are apt to be forgotten by the time they should be put in practice.

This year there are hundreds of farmers in the Maritime Provinces whose cows are now falling off in milk flow because of bare pastures. On the other hand, those who have grown some green feed, such as the oats, peas, and vetches, or corn, are reaping their reward in a well sustained return from their dairy herds.

The experience of this year should be either indelibly stamped on the memory or else an emphatic note made of it, so that every farmer who can possibly do so may sow a quarter acre, half acre or more to green fodder next spring.

THREE SILAGE CROPS AT COLLEGE FARM.

Any farmer within reach who is worried about providing feed for his cattle would find it worth while to visit the College farm and see the three silage crops being grown there this year. The O.P.V. mixture (oats, peas and vetches) comes first. There is a five acre field sown to this crop, and it is being put into silo this week (beginning August 9th). Then there is a four acre field of corn. This crop is making a better showing this year than for some time past. The third is an acre of sunflower. This crop has never before been tried on the College farm far silage purposes.

At the time of writing the bulk of sunflower appears to be nearly double that of the corn. The latter, however, will forge ahead during the next few weeks, but is not likely to overtake the new crop.

Farmers who are interested and are unable to see these silage crops for themselves would do well to write to Professor Trueman and get all possible information. A thorough test of the feeding qualities of all three will be made next winter, and reports will then appear in the press.

FALL PLOUGHING.

When is the right time, and what is the best method of fall ploughing sod land? Ordinarily the major part of the fall ploughing in Nova Scotia is left until the late fall season. At the Agricultural College, however, and on quite a number of farms in the province, the practice of commencing fall ploughing as soon as haying is over, and sometimes before, is adopted.

There are some big advantages in this system. Among these the three most important are: (1) The thorough rotting of the sod before the next seeding time. (2) The opportunity it gives to eradicate noxious weeds. (3) The assurance it gives that a most important piece of work will be done in good time.

Every farmer knows that a well rotted sod will provide plant food for the next spring's crop, and thus either give bigger crops or reduce the amount of fertilizer or manure necessary. For quick and thorough rotting three conditions are needed, heat, air, and moisture. Early ploughing ensures the first and takes full advantage of the third. The matter of air depends largely on the depth. Deep ploughing naturally reduces the air supply.

Early ploughing gives weed seeds a chance to germinate. Then, if the land is harrowed two or three times during the fall, practically all plant life is destroyed. There is no other method by which noxious weeds can be so effectively eradicated with as little labor.

The third advantage mentioned is obvious, viz., to begin early is to make sure that all fall ploughing will be done before winter sets in. While crop and labour conditions on many farms may not leave much time during the summer, yet, on most there is opportunity on dark and dull days, and no better use can be made of such days than in ploughing sod land.

All this is especially applicable in the case of pasture lands. In breaking up these the aim should be to get the best possible conditions for next year's crop, with the minimum application of high priced fertilizer or manure.

Certainly one cannot plough in August if the land is hard and dry. But it is often the case that a few mid-summer rains leave the land in better condition than will be reached again until late October. The Secretary for Agriculture states that he has observed a clover sod rot almost completely in a single month when turned over before the cool weather.

One exception to the rule of early ploughing is in cases when the farmer wisely decides to turn under a clover sod so as to increase the humus content of his land and thus add to its fertility. In such cases it is often desirable to get the maximum of aftergrowth before the land is ploughed.

An important matter to observe in early ploughing is the turning over flat of the sod. If a roller is available to press the slice down on the under soil so much the better. If the furrow is set up on edge and the sod thus partially exposed to the light there is sure to be growth, and very little rotting will occur. If, for any reason, the farmer prefers to set up the furrow slice, the land should be immediately harrowed so as to fill in the spaces between furrow slices.

Tuber Diseases of Potatoes

When digging potatoes, a number of diseases may be observed on the tubers; for example, spots of corky tissue on the skin, called Common Scab; or black surface spots which look like pieces of soil, but remain sticking to the tuber when it is washed—this is the so-called Black Scurf or Rhizoctonia. Again, there may be brown spots somewhat silvery, especially when moistened, the Silver Scurf disease. These diseases do not affect the edible qualities of the potatoes; only when they are badly infected is a loss incurred, due to a deterioration in the saleable value.

Later, however, after the potatoes have been in storage for some months, more or less rotting of the tubers takes place, which in bad cases may result in 30 per cent. or 40 per cent. of the tubers becoming valueless. The rotting may be observed externally through its causing spots to appear which are brown under the surface of the skin. This rot is due to Late Blight; this being a disease which first makes its appearance on the leaves as dead, water-soaked areas, occasionally killing the whole plant as well as infecting the tubers. Thus it is most important to spray your plants regularly during the growing season, particularly in warm and damp weather. Again, one may also find a dry rot with white pustules breaking through the surface; in this case the cause is a Fusarium Dry Rot, which is nearly always associated with a crack or bruise of the tuber.

Other diseases may be noticed when the potatoes are cut or peeled; for instance, a black discoloration extending from the skin inwards which is sometimes wet roted. This is Black Leg, a disease which also attacks the growing plant, causing an unthrifty condition which often results in the plant turning yellow, falling over and dying. It cannot be controlled by spraying, but is easily held in check by planting sound potatoes, for the disease is transmitted to the plant by the tuber.

To control these diseases it is necessary to adopt a careful routine for the selection and treatment of the seed tubr at planting time, and to provide the best possible conditions of storage. These two points are briefly outlined as follows:

Seed Treatment

1—Do not use seed from a field known to have been badly attacked by some disease.

2—Discard all cut, broken, or bruised tubers.

3—Before cutting, soak them in either: (a) Corrosive sublimate solution, 2 ounces in 25 gallons of water, for four hours. N. B.—Corrosive sublimate is a deadly poison; or (b) Formalin solution, 1 pint in 30 gallons of water, for two hours.

4—When cutting tubers, keep a jar of formalin at hand with a spare knife in it and, when a tuber is cut which shows any discoloration, discard it, drop the knife into the jar, and use the other one for the next tuber.

5—Do not plant potatoes in a wet, undrained soil, for such soil furnishes conditions favorable to many diseases.

Storage Conditions

1—See that the potatoes are thoroughly ripened, and exercise the greatest care to avoid any injury to the tuber.

2—Keep the temperature of the store room about 36 degrees, F. Potatoes freeze at 26-28 degrees, F., and freezing must be avoided.

3—There should be ample ventilation with sufficient moisture to prevent the potato drying, but not enough to cause water to condense on the surface of the tuber.

4—Direct sunlight should be excluded.

It is of the utmost importance to spray regularly during the growing season, since, more particularly in the case of late blight, mentioned above, there is a direct relationship between the diseased plant and the later rotting of the potato in storage. In this article, however, we haev aimed at emphasizing (1) the planting of healthy tubers, disinfected so as to kill externally adhering diseases and (2) the providing of conditions in storage which will reduce the losses from rotting to a minimum.

PRUNING RASPBERRIES

I set out some raspberries last spring and didn't have time to look after them. They have grown too long. I would like to know how to prune them. M. K.

For the black raspberry, you should prune by pinching out the tip of the young growing canes, when they are about 18 to 24 inches high during the summer. Be sure to pinch back the canes as soon as they have reached the desired height. To do this, it is usually necessary to go over the patch several times during the growing season, as all of the canes do not appear at the same time. Weaker plants result, if the canes are allowed to grow beyond the desired height and are cut back later. In the spring, the canes should be thinned out leaving only three to five strong canes to each plant, and all lateral or side shoots out back to 12 to 18 inches in length.

Some Common Dairy Feeds--Their Use in the Ration

Before the farmer can feed intelligently and economically he must study the individuality of each cow in his herd. Just as much as we need knowledge of an auto before attempting to run it, so we must know what the cow does with the feed she gets and how the different feeds affect her.

How a Cow Feeds.

Most dairymen know that the cow possesses four stomachs. The first one, or pouch, as it is called, is located on the left side of the body, the others being in close union with it. The cow is a seemingly fast eater. We wonder how she can hold so much and get filled up in such short order, but in reality she does not eat at all, but simply crams that pouch full of half-chewed food. lookc for a nice shady spot in the pasture, or lies down in the barn and begins chewing her cud. The cud is small morsels of food drawn from the pouch and up into the mouth, where it is thoroughly chewed, and sent back to the other stomachs, and digested and placed for different uses in the body.

This act of chewing the cud is one of the best indicators of good health that we have. Nothing is ever very serious with a cow if she is chewing her cud. Did you ever see a better expression of contentment than that of a well-fed cow chewing her cud? If she doesn't chew her cud daily, look to her, something is wrong; her digestive tract is out of order, possibly she is over-fed, too cold, barn poorly ventilated, or maybe you keep her in a perpetual state of fear. If you do she couldn't chew her cud if she wanted ed.

There is very little danger of a cow hurting herself by the use of good, clean roughage. That is, if judgment is used in feeding her. Not over forty pounds of corn silage should be fed daily, because silage is a succulent feed, is laxative to quite an extent, and is acid. The cow cannot stand that sort of a food and nothing else. How do we feel when we go for a day at the fair, eat nothing but candy, popcorn, soft drinks, etc.? Our stomachs won't stand for such treatment; neither will the cow's. She needs good hay, along with the silage and grain ration in order to do well.

Be careful of the grain feed; grain is the part that does the most damage when no care is used in feeding. Try to get feeds that the cow likes; that will increase the flow of milk and furnish some bulk; and then feed one pound of grain to every three or four pounds of milk produced. Such feeds as cotton-seed meal and beet pulp are unpalatable so they need to he fed with something that they like, just the same as mother puts sugar on the castor oil; we like the sugar, not the oil.

The feeding experts tell us that two-thirds of everything a cow eats is used for the upkeep of her body; the other third we get, in the form of milk, that is, if she is fed so that she will have it to spare.

The Common Concentrated Feeds.

Bran is one of the very best foods for dairy cattle. It combines many virtues for which it is difficult to substitute other feeds. Bran is bulky, being composed of the outer kernels of wheat. It is extremely palatable, and because of this palatability and bulkiness it has a cooling and slightly laxative effect on the system. We use much bran before and after the cows freshen. It puts them in fine condition to give easy birth to calves. A little brain placed into lukewarm water acts as a fine tonic and conditioner soon after freshening. The present high price of bran is what cuts down the use of this by-product to a great extent. However, we need not let this worrk us about getting a good ration, because alfalfa or clover hay comes so near to being equal in feeding value to bran that we can grow the bran part of the ration right on the farm.

Another feed that ranks high as a dairy feed is oats. As a single concentrated feed for all classes of live stock, oats have no superior. When ground, rolled or crushed they are easily digested, light, bulky, palatable, and when fed with clover or other leguminous hay they furnish feeding nutrients in about the right proportion. Oats are a safe feed to use on account of their light, bulky character. Very few cows ever go "off" feed when plenty of oats are fed. Oats are the great feed for horses. They contain the feeding value that give a horse nerve and energy.

Linseed meal is a very valuable feed for dairy cows, being high in protein and fat, and its having such a good effect on the cow's digestive system that small amounts should be included at intervals during the feeding period. The present high price of this food prohibits its more general use.

One of our greatest milk-making nutrients is cottonseed meal. Cottonseed meal is very concentrated in form, and must be fed with feeds more bulky in character. It is constipating in its effect on the system, so it should be fed along with such feeds that are very laxative, such as corn silage, bran, linseed meal, etc. It cannot be recommended as a feed for young calves.—O. V. Journal.

Care of Sick Animals on the Farm

On the farm where a number of animals are kept the owner seldom escapes without several cases of sickness among them each year. It may be a mere indisposition and it may be serious illness. Of course, when animals are really sick they should be given the best care and attention, and since it is not always possible to get a veterinarian when needed, and never possible to keep one on the farm, while the animals are recovering, the owner should understand how to handle them himself. When an animal is really sick, it should at once be removed from the other stock and put in a comfortable place. A roomy stall into which plenty of sunshine enters is an ideal place to keep the animal except during the hot summer time. At that time a cool shady place is best. Any kind of flooring may be used, but in winter concrete is somewhat cold. The floor should have clean straw spread over it and in colic cases this should be extra thick, but never bunchy. The door of the stall should be large, and the stall should be roomy enough so that any animal may wallow in it without injuring himself.

The Pulse

In sickness very little food is required, but plenty of pure fresh water never does harm. The animal should be fed and watered at regular periods each day. In acute stomach disorders, very little or no food should be given. Bran mashes, bright well-cured hay in small quantities and oats are good in cases of sickness. To make a good bran mash, take a clean pail, put in a gallon of wheat bran, a small handful of salt and pour it over a quart of boiling water. Cover the pail with a grain bag and allow it to stand for about twenty minutes when it will be cool enough for feeding. Some raw eggs and a few oats may be mixed with this if desired. If the animal can swallow and will not drink, give water as a drench. Drugs should ordinarily be given only under the direction of a competent veterinarian.

The heart action of any animal is determined by the pulse. The pulse of the horse and cow is found by feeling the small artery just under the lower jaw. The larger the animal the slower the pulse. The normal pulse of an ordinary sized horse is about 40 feats per minute. A false pulse indicates fever, of course, while a slow pulse indicates bad heart action or weakness from sickness. The respiration of an animal may be taken as an indication of the condition of his lungs, throat and bronchial tubes. Pain always accelerates breathing. A horse in normal condition breathes from 16 to 20 times a minute and a cow from 20 to 25. These points are very helpful in determining the nature of the sickness of the animal. Every farmer should have and know how to use a clinical thermometer. The place for taking the temperature is in the lower bowel. The most convenient thermometers are those having pear-shaped bulbs. Tying a spring clip to the thermometer by a short string and clipping the thermometer to the hair will keep the animal from shaking it to the floor. If the thermometer has no hole in it through which a string can be run, wrap a rubber band around it tightly several times with a string underneath.

The Temperature.

The normal temperature of the horse is about 100 degrees Fahrenheit. When inflammation is present the temperature rises. The thermometer will reveal oncoming sickness several hourse before the animal will show any violent symptoms of pain in many cases. The temperature of the cow is normal at 101 to 102 degrees Fahrenheit. In case of the disease known as milk fever, the temperature falls about three degrees. Inflammation of the generative organs runs the temperature rather high, as does also any lung trouble, which latter, however, could be detected by noting the breathing. The hog has a normal temperature of 102 tao 103 degrees Fahrenheit. The thermometer is one of the surest detectors of cholera known. When the temperature of the hog goes above 105 degrees or reaches it even, suspect cholera.

In cases of bowel trouble in an animal, injections of warm, soapy water are beneficial. Salt, turpentine or glycerine may be added in small quantities if desired. Poultices are often useful in case of accidents causing sprains, or other hurts, but they are mussy to apply. The best plan is to keep a reliable liniment on hand for such purposes. In applying the liniment, rub it in well.

Liniments go but skin deep at best; it is the rubbing that gives relief by causing blood to flow to the affected part and remove poisons caused by the injury.

In case an animal is sick for several days, give him clean bedding often, and if he is unable to turn over or get up on his feet, change his position of lying often. If a horse has shoes on, it is well to remove the shoes if they are sharp enough to be likely to injure him. If he is delirious rope his feet together. See that the sick animal rests with he head higher than the rest of his body. If bedsores appear, or the animal injures himself by rubbing against any sharp projection, paint the injury with iodine, and sprinkle on boracic acid powder. If the eyes are sore, wash them in a solution of boracic acid. If the owner finds that he cannot give a sick animal relief, he should take into consideration the value of the animal, and not delay in employing the services of a competent veterinarian, if one can be had.

W. H. UNDERWOOD.

FARMER MUST NURSE SICK WORLD

Factories can start up at once, but a demoralized agriculture will take years to restore—more years perhaps than we can afford to wait when all the world has returned to its senses and is ready again to settle down to busniess. Wherefore let the farmer, as is his wont, go ahead and plan for seed time and harvest, taking care only not to run too great risks in any single enterprise. In that way he will do much to hold the situation together—and we need somebody to steady the boat.

The farmer cannot expect large returns under present conditions. It does not even look as if the world is willing to work enough to pay him a decent price for food. But the world it a bit sick, and the farmer will have to underwrite the situation, as he has done before, and see society out of its tantrum. In a sense the farmer can afford to be patient; for whatever happens to the rest of the world, he is sure of three good meals a day and a good bed at night, fundamental luxuries "not to be sneezed at," as the old saying goes.

Wherefore, let the farmer keep both his temper and his courage the best he can, remembering that the Good Book says "A merry heart doeth good like a medicine." So shall the sick old world get well and the farmer will be its nurse, as he has always been.—Country Gentleman.

TILE DRAINAGE EXPERIMENTS.

Field Experiments—Most of the land drained at the Charlottetown Experimental Station is a sandy loam underlaid with a gravelly brick-clay subsoil. There is an impervious hardpan at from 14 tnches to 2 feet below the surface.

In June, 1910, an area of this wet land was sown to barley. The season was favourable, but for want of drainage the crop was not worth as much as the seed sown. That area was then drained, the laterals laid on 33 foot centres, and it has since produced regularly heavy crops of grain, roots and hay. In 1917, 35 bushels and 27 lbs. of barley were threshed from an acre of this land.

Draining Muck Swamp.—Two acres of a heavy muck swamp were cleared and drained by laying tile 30 feet apart, leading to 3 drilled wells 4 inches in diameter for outlets. These wells were drilled through brick clay, sandstone and limestone, until a strong spring was reached. They range in depth from 40 feet to 85 feet. One, about 65 feet deep, carried off over 7,000 gallons of water per day. Such wells are useful when the land rises on all sides and there is no satisfactory surface outlet. They require cleaning occasionally, as the brick clay oozes in and clogs tehm.

CHANGING SEED

Many farmers still think it advisable to change their seed grain every two or three years. In the light of the work done by the various experimental farms of Canada, this practice has nothing to recommend it, while on the contrary, it has been shown that there are distinct advantages in not changing seed. By the use of a good fanning-mill it is quite possible to grow the same grain year after year on the same farm and maintain its productivity, provided that the grain is seeded early each season on well-drained, fertile soil. The seed should not be blamed for poor farming, which is most frequently the cause of the farmer's dissatisfaction.

Many of those who favor a change of seed have possibly based their belief on faulty observations. An error that is often made is that of comparing the results of one season with the results of the next. If the seed has been changed between times and the second season is unusually favorable, it is assumed immediately that the change of seed has brought the increased yield. The weather conditions in different seasons may alone make a difference in yield of from twenty to forty bushels per acre, depending on the kind of grain. Again the use of different fields may give rise to the same error of judgment, also differences in the dates of seeding.

When the change of seed is made with a neighbor it is a gamble whether one gets anything that is superior to their own or not. The variety is usually doubtful, and the labor, cost and inconvenience have to be considered as well, while there is always a possibility of introducing noxious weeds.

There is one change of seed that every farmer who has been following this practice should make. He should change to the best variety of whatever kind of grain he is growing and stick to it. If he is not satisfied with his seed, he should discard it and buy seed of a well-known and proved variety. Its purity and productivity can be maintained by the combined use of the seed plot and the fanning-mill, and a change of seed is unnecessary.

GRADE—CROSSBRED—MONGREL

All animals that are not purebred are usually termed as being grades, which is a misnomer. A grade is the production of a pure-bred on the one side (usually the sires' side) upon common or unregistered stock on the other side, with the object of improving or grading up, and if good judgment is used, each generation will show improvement upon the previous one.

Possibly more advance is being made in live-stock circles through this practice than by any other. Crossbreeding is the making of pure breds of two different breeds, viz., a Hereford upon a Shorthorn, an Angus upon a Hereford, a Berkshire upon a Yorkshire, etc., etc., or vice versa—a system that is practised comparatively little, excepting in breeding hogs for the market or beef animals for the block or show purposes.

The third term, mongrel, occupies a larger place than many of us imagine, and, sorry to say, the word improvement cannot be applied to it, as can to the two other terms. While we occasionally hear it said of a pure-bred: "Oh, he is just a mongrel," that may apply to the individual, but not to his breeding. His breeding may be all right, but we can't say that of the mongrel, as it applies to inferior breeding.

A mongrel is the offspring of a sire and dam, both of which are of mixed breeding, while the sire or dam, or both, may be of fair quality, owing to some splash of pure blood that may be in them. The breeding is usually so mixed that their produce is no two alike, and none of them satisfying; no improvement in the herd, from year to year, no improvement in the community, no natural increase in the bank accounts, very few modern farm buildings or homes; in short, there is scarcely any pleasure or profit in spending a lifetime producing mongrels. Trying to make ourselves believe that we are producing grades is not much satisfaction, if the finances are not forthcoming to correspond. Better to right about face, and make a start with a few good animals, then feed them well, and success will surely follow.

THE DIFFERENCE IN FARMERS

Regions in which improved live stock is extensively bred and fed are distinguished by substantial, attractive farm residences, good barns and fences, modern structural and mechanical conveniences, and uniformly large crop yields. What is more significant, however, is that they are noted for the character and quality of the people who live in them. Men who engage in and remain identified with purebred stockraising have higher ideals and nobler motives than those who practise any other system of specialized agriculture which excludes live stock.

The average farmer is not interested in purebred live stock; it is the exceptional farmer who engages in its production. Stock-farmers are therefore a select class, unique in ideals, purposes and personal characteristics. By keeping improved farm animals they cultivate those human traits which find expression in kindliness and mercy; they also undergo a refinement of mind and heart which is always associated with neighborliness, fairness, justice and straightness.

A farmer may be a good citizen without even knowing the names of the breeds, but he would be a better one if he kept improved animals on his farm. Moreover, his boys would grow up to be better citizens, and in all probability remain on the farm. A boy who grows to manhood on a stock-farm, buys or inherits the farm, and dedicates his life to the improvement of the breed or breeds of his choice, is almost sure, to be a first-class citizen.

COMMON SENSE SAFETY

Those living in danger get so accustomed to it that they get reckless. They forget, or refuse to acknowledge that it is the gun that is "not loaded" that usually goes off and kills someone; that it is the "gentle" bull that unexpectedly gores someone to death; that it is the speed fiend who runs the auto into a pole, over a bank, or onto a track ahead of a train, and that it is the little injury that may develop blood poisoning or lockjaw. It is the old proverb in action—"Familiarity breeds contempt" to danger.

Every man owes it to his dependent family that he keep his health and his life. Recklessness may result in far reaching effects upon the family. It is not only the injured one who suffers. The death of a father due to recklessness may cause one or more of his children to grow up without schooling.

If guns were regarded as dangerous as gasoline, fewer accidents would result. If all bulls were considered as dangerous as mad dogs they would not claim so many victims. If ordinary care were taken in driving autos and motorcycles there would be fewer funerals. Safety devices are good, but ordinary, common sense caution will prevent many a sad story being put in the local newspapers.

AFTER 70 YEARS

"A great and successful farmer who had been farming for seventy years, when asked what was the greatest farming lesson he had learned, replied: 'The lesson that good farming pays better than any other business in the world; pays not only in money, but in health and contentment of mind. It is one business in which a man can live the Golden Rule every day, in all his dealings; and the longer he lives the more his satisfaction with it grows; and at the sunset of life he can look back over the years without a single regret, knowing that they have been well spent and that he has contributed his best to the sum of human happiness and lived closest to the Scriptural injunction as to how a man should live.'"

The farmer works for himself; the laborer works for another. The farmer tries to see how much he can produce; too often the laborer tries to see how little he can do and uses his organization to reduce production but at the same time to increase his income.

There is almost no limit to the amount of food, the quantity of clothing, the kind of housing, the number of automobiles, pianos, phonographs and what not other comforts or luxuries the world might have, if everybody would go to work with the understanding that it could have as much as it could make and no more. Then, if man would work at the job half as industriously as the boy will dig for worms while his fish pole leans by the tree, the world would literally be overflowing, not only with milk and honey, but also with every conceivable thing desirable for our care and comfort. We can have anything we are willing to work for, and cursed be he who shifts the responsibility to his neighbor.

The secret of success lies in the man, and not in the stuff he works on.

Farm tasks often seem to be all labeled: "Me next!"

Using Small Potatoes for Seed

After several years' experience in the use of small potatoes as seed, I feel impelled to make the results public. It s moire and more borne in upon me that potato growers have been dodging the use of small seed because of what they think should be the effect, whereas no such effect is to be expected.

When I started in to raise the potato crop I used the seed as it came from the lot, large and small, and either fed the surplus small tubers, or picked up the large ones and left the small ones to spoil. One year I tried two rows of little ones through the middle of the field. They yielded just one bushel more to the row, or 20 bushels more to the acre than the large seed. This gave me food for thought. The next year the potato crop was short and the price high, and I planted all of my early small seed (Irish Cobbler). The yield was fully as good as that of the large cut seed, one end of the piece going at the rate of 240 bushels per acre.

From that time on, I always saved the small seed from the fields that had been planted with large seed, but continued to throw away the small seed from small seed. After about three years' additional experience I have at last brought myself to the point where I am perfectly brazen about using small seed. I have been watching results now for seven years and have yet to see the time when seed cut to two-eye pieces weighing about an ounce have beaten small seed of the same weight when soil and moisture conditions were equal, whereas the small seed have come out ahead repeatedly. I have had 300 bushels of Irish Cobblers to the acre from small seed, while the best the large seed has done is 190 bushels. This year is a good example. I have eleven acres of potatoes planted from small seeds and one-half acre from large seed, selected during two years by the tuber unit. This last is my seed plot. Part of the small seed was from small seed last year; in fact, fully two-thirds of it, and some of this was from small seed the year before.

The yield from the small seed averaged 120 bushels per acre, that of the seed plot 102 bushels per acre. The seed plot was planted under test conditions. They were planted on the same piece of land, with the same amount of the same kind of fertilizer, and were planted at the same time as the last acre of the small seed. The last acre of the small seed averaged 148 bushels per acre, as against 102 for the seed plot. It should be understood that all this seed, large and small, is from the same lot originally.

Small seed is supposed to cause the crop to run small, but the seed plot had 15 bushels of small seed per acre as against 32 for the small seed which is exactly the same ration as the yield of large potatoes.

The reasons for the increased yield are as follows:

Small seed is less affected by unfavorable conditions than cut seed.

Under favorable conditions there are more vines from the small seed than from the cut seed, hence the yield is likely to be larger.

The sprouts from small seed come mostly from the seed end of the tuber, and these are more vigorous than those from the stem end.

In my case a large proportion of the small seed is not entirely mature.

As an illustration of the better growth under unfavorable conditions, in 1917 the spring was very wet, and my seed rotted in spots. In these spots some plants appeared, and on investigation I found that these were nearly all from uncut seed; in other words, where 90 per cent of the cut seed rotted, 90 per cent of the uncut seed grew.

In cutting seed in large quantities it is not practicable to cut the same number of eyes on every piece. Sometimes there are pieces with one eye or even with none. This makes missing hills and small tops and cuts down the yield.

The potato is an underground stem, and on them as on twigs of trees and other plants, the terminal buds (seed end in the case of the potato) are the most vigorous, and start into growth first. Cut seed must either be split lengthwise giving long thin pieces, with a large cut surface, or part of the pieces must be from the stem end.

Contrary to the popular belief, seed which is dug before it is fully mature is superior to that which is mature. I am unable to state why this should be so.

No one of these things makes a great deal of difference in the yield, but together they account for the increase.

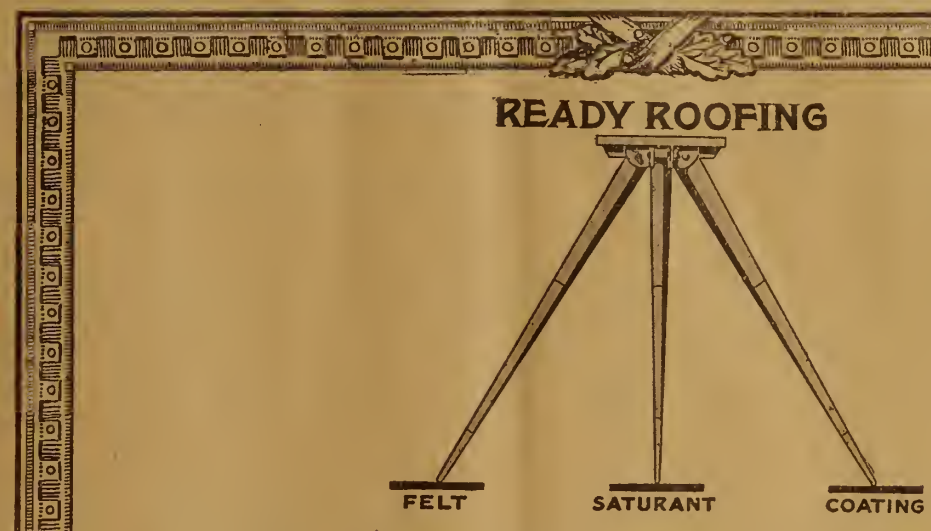
In England, where the large growers go into the matter of seed in a thorough and scientific manner, they plant special seed plots from selected seed, which is planted twice as thickly as usual in order to get a heavy yield of small tubers. These small potatoes are reserved for seed, while the large ones from the seed plot are sold. They are dug from ten days to two weeks before they are fully grown.

In my own case I raise a seed plot of a half acre every year, always using large seed. This is for insurance. If I ever see that my small seed is running out, all I have to do is to discard it and plant all large seed one year and then commence over with the small seed regime. The time to do this would be when potatoes are cheap.

In addition to the above advantages in growth I must mention the fact that cutting seed is an expensive and time consuming operation when done on a large scale, and with labor scarce and every minute valuable at planting time this is a large item. Also it should be mentioned that the small seed works better in the planter than cut seed.

Lastly, the question of economy enters into the matter. When one can use as seed, potatoes that otherwise would be fed out or wasted, and sell the potatoes that otherwise would have been used for seed, it saves the grower from $6.00 to $24.00 per acre.

When saving small potatoes for seed one should use some judgment in picking up. Whenever there is a hill that has all or nearly all small potatoes, I have it discarded, and also this is the time to throw out any of the odd varieties.—A. H. Graff, New York.



The Tripod of Ready Roofing

There is much more to ready-roofing than appears on the surface. You can't judge a roofing by its looks alone.

The three principal elements of ready-roofing—felt, saturant, and coating—may be compared to a tripod. This tripod supports the quality of the roofing. If one leg fails, quality suffers. When you buy Ru-ber-oid you know that no flaw will develop and a leaky roof result. The tripod which supports Ru-ber-oid Quality is sound at every point. Briefly, here are the facts:—

Felt

The backbone of ready-roofing is felt. Upon its quality, primarily, depends the life of the roofing. Because of this fact The Standard Paint Company of Canada makes, in its own factory, the felt which goes into Ru-ber-oid Roofing. This important work is intrusted to no outside concern. We know that only materials of the highest grade are used in the making of our felt.

Saturant

The saturant, properly compounded and applied, preserves the felt and will remain unchanged for many years. *It will not evaporate.*

The saturant used in Ru-ber-oid is composed of the highest grade of bituminous materials. It is forced into the felt under heat so that every pore is filled. *It stays where it is put; it cannot evaporate.*

Coating

The function of the coating is to seal in the saturant. Ru-ber-oid coating compound is a special mixture of animal and vegetable matter compounded with high grade asphalt. These materials can be mixed in many combinations but the one used for Ru-ber-oid will last longest without becoming hard or brittle, peeling, powdering, blistering or drying up.

HORTICULTURE.

THE SUMMER CARE OF THE STRAWBERRY PLANTATION.

The strawberry plantation very often receives little attention during the first year, resulting in much disappointment in crop the following season. Weeds or grass, if allowed to grow, take up nourishment that should go to the developpment of good strong plants, without which abundant crops cannot be hoped for.

The usual system is to grow the plants in the matted row. The plants are set about fourteen inches apart in the row and from these runners develop forming a number of plants. These runners should be handled before they strike roots so that the plants will not be bunched together. The plants should be spaced about six inches apart, and the row allowed to form about twelve to fifteen inches wide. It is wise, in cultivating, to run the cultivator always the one way between the rows as in this way the rooting runners are not so liable to be disturbed. The cultivator will tend to draw the runners lengthwise of the row so that they require less handling and will form a better row than if attention is not given to this detail. The strip of plants gets wider and wider, from the runners sending out new laterals and plants forming, so the cultivated space between the rows becomes correspondingly narrower and narrower, making it necessary to use care in closing up the cultivator, or in not cultivating too close to the roots of the plants.

It should be kept in mind that the older plants have the best development of roots and crown and every care should be given not to disturb the early-rooted plants by careless handling. It will be seen, therefore, that, as soon as the runners commence to form, the only way to keep the part where the plants are growing free from weeds is by hand work, hence the importance of being thorough with the early cultivation, keeping the ground mellow and destroying weeds that may start at that time. Shallow cultivation only is necessary and broad teeth on the cultivator that leaves the soil ridged are not desirable.

Careful hoeing is necessary, otherwise the plants striking roots are likely to be disturbed. Much of the work can best be done by hand pulling the weeds which start. It is exceedingly difficult to handle the plants where couch grass is abundant, and, should this be the case, work with the hand trowel may be necessary. The plants may be handled to advantage by spacing them to avoid more than one plant in a place as much as possible and pressing the plant ready to root into the soil lightly or working a little extra soil around it at this point.

Toward autumn the row should be restricted by cutting off the runners along the edge when enough plants have been formed, and new runner plants forming within the latter row may be cut as well thus avoiding the formation of small late plants which may be abjectionable as weeds.

It will be seen, therefore, that to attend to this properly means considerable work, but it has been found that it pays to give attention to these details if the best returns are to be looked for.

The hill system may be employed. This consists of growing the individaul plants in hills and all runners are cut off as soon as they begin to form. If this is done, the individual plant makes many crowns, or buds, close to its base and becomes a broad, stocky plant capable of developing many clusters on its various crowns thus producing an abundance of fruit. If a plant is allowed to form runners these buds will not multiply at the crown, but it will produce from its runners a colony of plants around it, each forming a crown of its own. It will be seen therefore that, if the hill system is to be a success, close attention must be given to keeping all runners that form cut off and this must be done right into the autumn. This means considerable labor, but, if followed properly, large fruit crops are possible.

One advantage of this system is that hoeing can be done close to the plant, and the plants may be cultivated both ways. The plants are easily cultivated next season and, if earth is worked up to the edge of the old plant from year to year, they may continue to crop for several years.

The mulching of the strawberry patch as soon as the ground freezes, usually about the first of November, consists of placing a light coating of straw over the plants. Thih should be scattered lightly, just sufficient so that the plants may be seen at places through the straw. Too heavy a coating is not desirable. Brush may be used for this purpose.—W. S. Blair, Superintendent, Experimental Station, Kentville, N. S.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

AGENCIES EVERYWHERE

CANNING, DRYING AND STORING FRUITS AND VEGETABLES.

It is now the season for canning fruits and vegetables and, though the price of sugar may be high, thus tending to discourage housekeepers from canning as much fruit as they otherwise would do, yet there are few who will care to be without a fair supply for the long period until the fresh product is available again.

Every year a large number of cans of fruit and vegetables spoil, and, especially under present conditions, it is important to reduce the loss to a minimum. This is done by ensuring thorough sterilization of the jars into which the product is put and thorough sterilization o fthe product itself. The germs of decay, moulds and bacteria are practically always present and unless destroyed, will attack and spoil the fruit and vegetables. Moulds usually form on the surface only, but when the product becomes soured the whole o fthe product is spoiled. This souring, or "Flat Sour" as it is called, is due to various causes.

In the bulletin on "The Preservation of Fruits and Vegetables," issued by the Horticultural Division in 1919, the author, Miss Margaret Macfarlane, gives the ollowing causes for Flat Sour:

1. By the vegetables being allowed to stand in the cold water of the blanching period for a longer time than is necessary. Never blanch or cold dip more than you can pack at once.

2. By the jars being allowed to stand after being filled with boiling water, before being placed in the canner or sterilizer. If one or two of the jars are in the canner a few minutes longer than is necessary the fruit or vegetables will not be affected, while if the jar were left on the table for a corresponding length of time "flat sour" might be started.

3. By the jars being placed close together after being taken from the canner which prevents their cooling rapidly.

4. By the product being allowed to stand over night before canning. Peas, beans, corn and asparatgus which are over-ripe or too mature when canned will readily "flat sour."

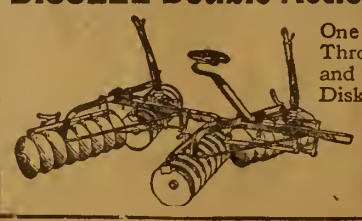
To prevent "flat sour":

1. Can within five hours after picking.

2. Can only young, tender, fresh products.

3. Blanch, cold dip and pack one jar

BISSELL Double Action Harrows will thoroughly cultivate and pulverize any soil. One Harrow is Out Throw; the other is In Throw. They are simply constructed, rigid and durable. The Gangs are flexible and the Disk Plates are so designed that they "hang" right into the soil. Bissell Harrows are built in sizes and weights suitable for horse or tractor use. Write Dept. M for free catalogue. 98



T. E. BISSELL CO., LTD., Elora, Ont.

of the product at a time, and place each jar in the canner as it is packed. The first jar will not be affected by extra cooking.

4. Cool the jars as quickly as possible, but do not let a draught strike them.

Another important factor in successful canning is the preparation of the canning utensils. The following quotation from the bulletin already referred to deals with this:

"If jar has been used the previous year, special attention must be paid to washing. Wash carefully in clean, hot, soapy water. Rinse in hot water and test. Test every jar, top, and rubber. See that the edges of the jar or top are not rough, by running your finger around the edge. All sharp edges should be filed or scraped off. Fill each jar half full of warm water, adjuts the rubber, put on the cover and snap the wire clamp. Turn jar upside down to see if it leaks. In using a Perfect Seal jar, if the jar leaks, the clamp may be tightened by turning the spring of the clamp underneath the word "tight" on the neck of the bottle.

Never use a rubber ring which has been used before. Old rubbers lose their ealsticity, are brittle and break when stretched. Test rubber by folding the ring and pressing tightly. Turn it over and reverse the fold in the same place. A good rubber ring will show no crease or break where the rubber has been folded.

After the jars have been tested they should be put on in warm water and boiled for 10 minutes. The tops and rubbers should also be sterilized for the same length of time.

Fruits and vegetables can be dried quite successfully and simply, and many take advantage of this. Where one is assured of lot, bright days, drying in the sun is the easiest method. The plan is to spread the product out thinly on something clean, and then to ensure its being protected from dust and insects it is covered wtih cheesecloth, which permits a circulation of air, the cheesecloth being supported on a frame and not directly on the fruit. The fruit or vegetable should be turned once or twice a day. The product should be taken inside at night and if rain threatens. Another method is to dry in the oven or on trays hung over the stove. When sufficiently dried the product should be somewhat pliable rather than brittle. The latter condition is often found when drying is done too rapidly. The dried product is left in open boxes for a few days to make sure it is sufficiently dried and pour from one box to another each day to mix thoroughly and ensure all being dry. It is then put in tightly closed cans or even strong paper bags well closed. Beans, celery, corn, peas, onions and pumpkin are among the vegetables that may be easily dried. Apples and resp-berries are two of the most satisfactory fruits.

In storing fresh vegetables for winter it is well to remember that onions must be kept very dry. They should be dried as much as possible outside, and when brought in spread out thinly in a well ventilated place. If stored with much moisture in them they are very liable to rot.

Celery needs moisture at the roots when stored, but the tops should be kept dry to lessen danger from disease.

One of the best methods of ripening green tomatoes is to store them before they are touched with frost in closed drawers in a room where the temperature is between 60 and 70 deg. or above.

Potatoes should be dry when stored as there is less likelihood of rot if there is disease in them. A dry, cool. well ventilated cellar where the temperature is between 33 and 35 deg. F. is best for potatoes.

Squash should be stored in a comparatively warm, dry place if they are to keep well. The temperature should be about 50 deg. Fahr., or more.—W. T. Macoun, Dominion Horticulturist.

Currant Jelly

The best zest with all red meats

A pretty and economical cake filling

A beautiful garnish for fancy desserts

MAKE plenty of currant jelly. All men like this piquant sweet. Children never get enough of it. You can use it in many ways by itself or in other dishes. Good home-made jelly is not only an enjoyable relish but a nourishing and valuable food.

A Reliable Recipe for Currant Jelly

Gather the currants as soon as they are red. Do not let them overripen. Wash and mash them lightly in the kettle. Heat slowly until the skins look blanched and transparent. Turn the hot fruit into a flannel jelly bag wrung out of warm water and let the juice drip through slowly. It will take several hours. Measure the juice into a clean kettle and boil hard for ten minutes. Do not boil more than six or eight cupfuls at a time. Meantime heat in the oven a cup of LANTIC PURE CANE SUGAR for each cup of juice and add this at the end of the ten minutes. Under the most favorable conditions the jelly will begin to coat the spoon by the time the sugar is all dissolved. Sometimes it will need to be boiled for a few minutes more. You can tell when the jelly is done by trying a spoonful on a cold dry plate.

For all Jellies Use Lantic Pure Cane Sugar

It is pure and reliable and dissolves quicker. At preserving time you will find the larger packages specially convenient.

2 and 5 lb. cartons
10, 20 and 100 lb. sacks

Preserving labels free : Send a red ball trade-mark cut from a bag or from the top panel of carton and we will mail you a book of assorted preserving labels, gummed and printed ready to attach to the jar. Address

DAIRYING.

ROPY MILK ON THE FARM.

(H. A. Harding and M. J. Phucha, Illinois Agricultural Experiment Station.)

The term ropy milk or slimy is applied to milk which has become noticeably more viscuous than ordinary milk. When this ropiness is only slightly developed it is ordinarily overlooked. It is sometimes noticed from the fact that the milk pours more slowly or because the last portion drips from the container with the formation of an evident thread of milk.

Where the viscosity is more pronounced, the milk may be drawn out by means of a fork, or similar object, into threads. In extreme cases these threads may be fine and silky and more than a foot long, though more frequently they break when only an inch or less in length.

In extreme cases the milk takes on almost the consistency of a sticky, stiff dough, and a cup of it may be inverted without the milk being spilled.

Ropy milk should not be confused with the results of garget. Garget is an inflamed condition of the udder of the cow, and milk as it comes from such inflamed udders frequently contains white masses or strings of coagulated material. Milk which becomes ropy, on the other hand, comes from healthy udders and is normal when drawn, but the ropiness may appear at any time after twelve hours.

Why is Roppy Milk Objectionable?

With milk, as with other foods, custom is a large factor in establishing market demands. There is no question but that our retail milk trade calls for a sweet milk of normal consistency and taste. While the growth of the ropy milk germs ordinarily produces little change in the taste of milk, these organizations do change its consistency so noticeably as to arouse the suspicions of the consumer.

The agitation of recent years for milk of low germ content has made the consumer very suspicious of any evidence of germ growth in milk and doubly so of unusual appearances.

While there is no evidence nor any reason to believe that the growth of the ropy milk organism is in any way harmful to the consumer, such milk is not acceptable to the American consuming public, and accordingly is neither profitable nor desirable in the city milk supply.

Why is Ropy Milk so Common a Trobule?

It should be remembered that the germs of ropy milk which ordinarily make trouble in connection with the city supply do not thrive in connection with the ordinary acid-prpoducing germs. When milk is produced wtih a lack of care as to the utensils and is handled without proper regard to cooling, the rapid development of the acid-producing germs interferes with the activity of the ropy milk organisms even if present.

Before the cause of ropy milk was clearly understood, a treatment often recommended was to rinse all utensils with sour milk and allow them to stand some hours before washing. In this case the remedy was worse than the trouble it aimed to cure because it resulted in the quick souring of the milk, but it was efficient in checking the development of the ropiness. The germs producing roppy milk thrive at a temperature much below that most favorable for the growth of the ordinary acid-producing germs. Accordingly, when the ropy milk germs are present, cooling of the milk checks them but little and in such cooled milk they have an advantage over the acid producers.

It is a matter of common knowledge that during the warm summer weather the acid-producing germs develop quickly in the milk and unless considerable care is exercised the milk does not remain sweet for twenty-four hours. On the other hand, in the winter the low temperatures are favorable to the development in the milk of quite a different class of germ life, with the result that if the milk is kept cold it will frequently remain sweet for two weeks and even then will not become sour but will undergo undesirable changes.

In the spring when winter is changing to summer conditions, and again in the fall when the reverse change takes place, the germ life in the milk is quite variable. At these times of the year a majority of the outbreaks of ropy milk appear. In case an outbreak at such a time becomes well established it may persist for some weeks or months.

Samples taken in connection with many different outbreaks on farms have ordinarily shown that the utensils are the source from which the

Heart Pains So Bad

SAT UP MANY NIGHTS.

A large majority of the people are troubled more or less, with some form of heart trouble, and that distressed feeling that comes to those whose heart is in a weakened condition causes great anxiety and alarm.

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken, and thus secure prompt and permanent relief.

Mrs. Thomas Hopkins, Crowell, N.S., writes:—"I had heart trouble for several years, sometimes better and sometimes worse, but a year ago last fall I could not lie down in bed for that distressed feeling, and had to get up and sit up a great many nights, and when I did lie down it was with my head very high. I purchased two boxes of Milburn's Heart and Nerve Pills and feel a lot better. I can now lie down quite comfortably and the pains have gone too."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

ropy milk germs enter the milk. Since the utensils on the farm are commonly all washed together it is to be expected, and it is common experience, that where one is infected, the ropy germs are present on many or all of the utensils. It should be noted in this connection that in an outbreak studied by one of the authors in New York, the ropy germs were found only in the cans, and the indications were that in this outbreak the cans were being contaminated while being washed at the milk plant.

The source from which the first utensil became contaminated in the outbreaks which have been studied has not been made clear. The germ which has been most commonly found in ropy milk was originally found in water, and in outbreaks on the farm it is often found in the water in the cooling tanks. As in such outbreaks the germs are also found in the utensils it is customary to explain the presence of the germ in the cooling tank as resulting from the infected cans having been put in the tank. Where no definite information is at hand to explain how the utensils became infected it is quite as logical to assume that they became infected from the water. The assumption that it is a form occurring occasionally in water and that it occasionally finds its way into milk is supported by many of the known facts. Such an assumption also serves to explain the wide distribution of this trouble as well as its occasional appearance without any known connection with any previous outbreak.

Ordinary Treatment on Farms.

Dairymen are usually most interested in promptly removing the source of infection, even if this summary treatment involves perhaps a little unnecessary work.

Under cooling conditions the trouble is most effectively attacked by emptying the cooling tank, scrubbing it, and filling it with clean water to which some active disinfectant is added. A twelve-ounce can of good strength bleaching powder (chlorinated lime) added to a 100-gallon tank will give a powerful disinfecting solution. In case the tank has a capacity of more than 200 gallons, additional bleaching powder should be added.

All pails, strainers, stirrers, cloths, brushes, and other utensils which come into contact with the milk are then put into this solution and allowed to remain fifteen to twenty minutes. The tank and floor of the milk house are then scrubbed with the disinfecting solution. Where facilities are at hand, the interior of the milk house may be whitewashed, or it may be drenched with the solution from the tank.

Where a cooling tank is not used, but a large iron kettle or food cooker is available, the same result may be attained by filling this with boiling water and giving all cloths, brushes, and utensils a thorough treatment with hot water.

Where the dairy is located near a canning factory, all these utensils may be placed in a large steam kettle and an exposure to the influence of steam under pressure will promptly destroy the ropy milk germs.

Bottling plants are often provided with steam chambers in which these dairy utensils may be quickly and thoroughly treated.

Bringing all parts of these utensils to the temperature of boiling water, or exposing them to the action of a strong disinfectant for a few minutes, will kill all germs of ropy milk. Accordingly a single treatment of the cooling tank and the utensils usually puts an end to an outbreak on a farm.

It should be understood that this exposure to heat or to disinfectants followed by thorough washing leaves nothing on the utensils which will prevent the growth of ropy milk organisms if they find their way to the utensils after treatment. In actually carrying out such a disinfecting campaign at the farm it occasionally happens that some pail, dipper, or other object which has been in contact with the ropy milk, is overlooked. If in connection with the handling of the milk the germs on this one utensil spread to the others, the result of the disinfection is lost and the trouble will reappear in the milk. Fortunately in the actual handling of outbreaks the trouble rarely reappears where the work is carefully done.

POUNDS MILK FOR POUND BUTTER OR QUART CREAM.

The number of pound of milk necessary to contain enough fat to make a pound of butter or a quart of cream depends upon the fat content of the milk and cream. Milk averages a test of approximatelyy 3.8 per cent. fat. Since about eight-tenths of a pound of fat is sufficient to make a pound of butter, it will require approximately twenty-one pounds of 3.8 per cent milk to supply this fat. A quart of 20 per cent. cream contains approximately four-tenths of a pound of fat. It will take about ten pounds of 3.8 per cent. milk to furnish this quantity of fat.

It will require approximately eight pounds of 5 per cent. milk to furnish the fat in one quart of 20 per cent. cream and about 16 pounds to furnish the eight-tenths of a pound of fat necesasry in the making of a pound of butter.

TRAINING OF SHOW ANIMALS BIG HELP IN WINNING PRIZES.

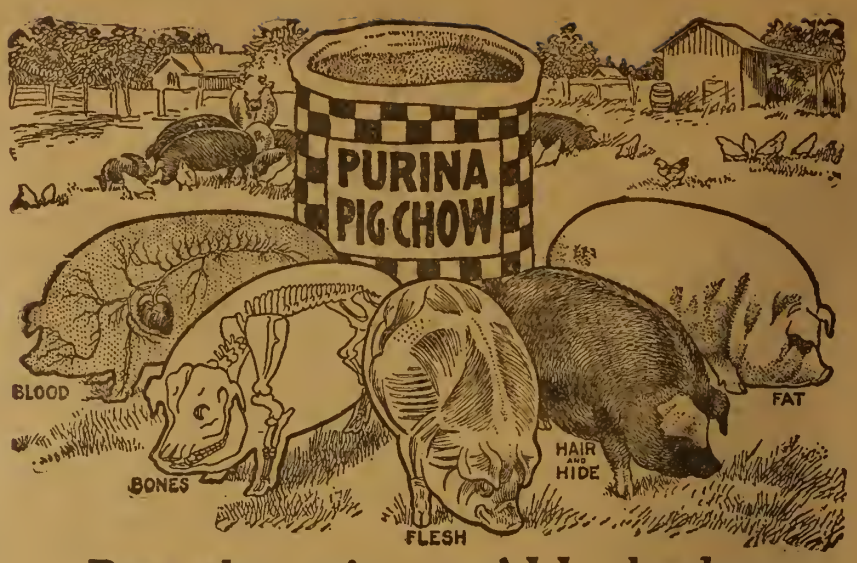
Time marches on and another midsummer is approaching. The rigors of the past winter have now been forgotten and with them also disappear the mud and dirt of early spring, till nothing remains but the memory of the uncomfortable days spent a few months ago. What a change from the cold, bleak plains of a February morning, with its whistling winds and shuddering trees, to the calm quiet of a June day, brightened by its luxuriant growth of foliage, rippling waters, and singing birds. It seems hard to understand how, in the space of a few short weeks, everything could be changed from its apparently dead appearance of the winter months to the healthy, laughing universe of today. The crops are growing rapidly and everything points to prosperity for the patient tiller of the soil—the farmer. Truly it is a most wonderful change, and one that puts new life into every living creature, but yet it is no different to what has appened every year since the beginning of time.

On the other hand, each new season brings its problems and its difficulties. It seems but a few short months since the live stock men were engaged in the hustle and bustle attending stock shows and exhibitions, and here they are upon us again. During the years that the world was engaged in the greatest struggle in history, the shows went on successfully. Of course many stockmen were prevented from showing on account of the war, but that cannot be advanced as an excuse this year. Many breeders have the stock and are just as anxious for the show game as ever, so that this year will be a record in showing, not only at the large fairs, but at the local exhibitions as well. The county feels the relief of peace, and in place of war has taken up another form of activity, namely, reconstruction, which has a mighty bearing upon the live stock industry of Canada.

It is not too soon to begin training now the pospective show animals so that they will appear to the best advantage. Show animals no matter of what breed or class require a lot of training, and it is an unfortunate truth that too few of our show men pay as much attention to the training of their show animals as they should. Only a few months ago the writer had occasion to stand at the ringside of a leading exhibition while several classes of live stock were being judged, and it was impossible to escape observing the apparent lack of show ring training that fully seventy-five per cent. of the animals in some of the classes had received. Some breeds suffered worse than others and some classes showed glaring examples of lack of pervious training and, worse still, their owners or grooms held them most carelessly while under the scrutiny of the judge. A most glaring example of this was in a certain class of aged bulls, and while the judge was standing at a distance, surveying the animals, no less than two out of the eight entries had their heads almost down to the ground, while a third was almost as bad. The showing they made certaintly was an advertisement for their owners, besides besing a grave source of danger. Such glaring examples of incompetency are usually always exhibited by amateurs who, of course, will improve with experience, but there is absolutely no excuse for such carelessness.

The show business is a great game and one must cultivate the spirit of give and take, yet after all it is one of the most difficult works it is possible to undertake and requires the greatest skill. Showing animals is an art, and it is doubtful if it can be taught to anyone unless they have the natural instinct and love for live stock, and although every stockman cannot become a real expert showman he can be the next thing to it by being careful and have his animals trained before entering the ring. The final decision in a close fight nearly always hinges upon the man showing the animal. It matters not whether it is a horse, cow, sheep, or a pig, the manner of showing has a great deal to do with the impressions made upon the judge, and, consequently, with the final awards, and it is not a rarity to see a poorer animal placed over a good one simply because the better was not shown properly, and its good qualities not brought out before the judge.

Such things are serious handicaps more especially for amateur exhibitors, and no time should be lost now in fitting the intended animals for the coming shows. A few minutes daily spent trainiug animals from now until show time will make a tremendous difference in their apeaprance on show day, and will also strengthen their chances of winning a prize. Showing live stock today has got to be such an art, even at our local shows, that it is very difficult to win unless the anials are properly train-



Puts the gain on ALL the hog

All-'round development is what the hog feeder wants, insuring higher *grade* pork as well as higher finish.

Purina Pig Chow is a scientific balance of concentrates for making bone, flesh, blood andfat. It develops and fattens pigs simultaneously, and brings hogs up to a maximum weight in record time. One feeder last year cancelled a car of Purina Pig Chow, because this feed finished out his herd a month earlier than he expected.

Purina Pig Chow contains Hominy Meal, Digester Tankage, Blackstrap Molasses, Ground Barley, Corn Gluten Meal, Cracked Corn, Linseed Oil Meal, and Alfalfa Flour, with a trace of charcoal and salt.

Compared with corn, barley, shorts, hominy or similar ingredients by weight, Purina Pig Chow will produce 100 lbs. of live hog with one-third to one-half less feed. Fed individually or in combination with other feeds, Purint Pig Chow will produce 25 to 50% more weight.

ed, and no one can afford to take a chance regardless of how good his animals may be. They should be fitted and trained before leaving home, and there is plenty of time yet if a start is made shortly. It is not a difficult matter to learn an animals to lead properly and to stand without showing fear of strangers or passers by, but the only way to get them in that happy position is to so handle them that they show no efar of the attendant and have confidence in him. What is more provoking in the show ring than to see an animal when led out before the judge go sideways to its attendant or grooom There is nothing wrong but fear of the man on the halter and that is a fault that can be easily remedied before the show. It takes time and patience, but if an animal is worth taking to the exhibition it should be worth training at home.

CAUTION TO ONE CONTEMPLATING INBREEDING.

One of my neighbors has an exceptionally fine bred Guernsey bull. I have my entire herd of cows with calf by him. Shouldn't the heifer calves from this bull be bred back to him to conform to the best practices in breeding I maintain that it is best but several of the farmers in this community say "No." Isn't this called "line-breeding" and isn't it the practice of our most successful breeders of live stock?

A. B. D.

The practice contemplated in this breeding herd is one which has brought about a great deal of the improvement which has been made in our pure-bred breeds. There is no question but that inbreeding and line-breeding, properly directed, are systems from which splendid results may be expected. The difficulty comes in the fact that very few men are able to direct this breeding correctly. With inbreeding and line-breeding the characteristics of the animals mated are intensified. Is this bull so good that it is desirable to impress his qualities strongly in her herd? I fhe has bad points about him, these will quite as certainly be made prominent in his inbred offspring as will his good qualities.

Breeding this bull to his own get cannot properly bet termed line-breeding, since line-breeding usually is used to indicate a system where the mated animals are less closely related. An arbitrary definition of line-breeding specifies that the mated animals shall have not less than 25 per cent. or more than 50 per cent. of the same blood. If this bull suits our inquirer's ideal of the breed and his heifers are vigorous and of strong individuality, inbreeding may be followed safely. We caution, however, that while good results may be secured from this system, very bad resutls may also follow, unles sthe animals are well chosen. It is in most cases a matter left with best profits to breeders of long expereince and close students of their animals.—Breeders Gazette.

SORES ON PIGS' MOUTHS.

I would like to know what is the matter with my pigs. They are about four weeks old and several of them have ulcerous spots and patches about their jaws and faces. They are not doing well. K. C.

Ans.—From the details given, it appears that the pigs are suffering from necrotis stomatitis, a disease which causes deep ulcers to form on the lips, gums and snouts of pigs. The disease is caused by filth germs invading scratches about the nose. The germs are present in the intestines of hogs and prevalent in manure and filth of pens and yards, where hogs are or have been present. In many cases, the disease is fatal and in others the pigs become stunted. Affected pigs should be isolated immediately. Scrape the ulcers clean and paint with tincture of iodine. Then swab daily with a 2 per cent. solution of permangenate of potash on an absorbent cotton tied on a stick. The lumps should be painted with tincture of iodine. It is best to burn pigs that die.

Like most diseases, prevention is easier than cure. Clean and disinfected farrowing and living quarters should be provided. A common way of getting the disease is through the wounds resulting from cutting off the sharp teeth of little pigs. These need not be cut off and it is not necessary to remove black teeth.

PEERLESS PERFECTION
PEERLESS
FENCE
FOR CANADA'S BROAD ACRES
Put up a fence that will last a lifetime—a fence that can't sag or break down—that will hold a wild horse—that hogs can't nose through—that can't rust—a fence that stands rough usage by animals or weather and is guaranteed. PEERLESS PERFECTION Fencing is made of Heavy Open Hearth Steel Wire with all the impurities burned out and all the strength and toughness left in. Heavily galvanized. Every intersection is locked together with the Peerless Lock.
Stiff stay wires keep it rigid, making fewer posts necessary. Send for Catalog today. It's attractive, interesting, well worth the stamp. Best dealers throughout Canada handle our complete line.

RINGWORM IS VERY CONTAGIOUS

I have some cattle that have ringwork around their eyes and ears. The hair comes off and it is spreading all the time. What can be done to cure it? M. R.

Ringworm is caused by a vegetable parasite which lives on damp walls and woodwork as well as on the skin of animals and man. Isolate the affected animals, as the disease is very contagious. Treat the spots on the face and ears by scrubbing free of scabs and crusts, first saturating them daily with sweet oil. Then apply tincture of iodine twice daily. Rub iodoform powder into the spots upon the upper eye-lids, as the liquid iodine might run into the eyes and do damage and will be very painful. It will be well for you to get the animals clear of disease before you let them out on pasture, as there they would be liable to relieve the itchy feeling by rubbing on fences, etc., and in this way the disease would be spread. Cleanse and disinfect all the stalls and woodwork in the barn or in the yard where affected cattle have been exercising, and whitewash them with lime wash.

Teach the pigs to eat grain as early as possible. If they are given a chance, it will not take long for them to learn. Arrange a feeding pen for them separate from the sow by building a partition in one corner of the sow's pen eight inches from the ground. This allows the pig to crowl under, but keeps the cow out. When the pigs are four or five weeks old, place a trough in the pig section of the pen and feed the pigs a little warm milk sweet twice a day.

Be careful to wash out the trough every time before the milk is poured into it, and place it where the sun will shine into it between feeds. Cleanliness is very important, and if the pigs get milk that has soured or is filthy, it is very apt to cause scours or other digestive troubles.

Every farmer who keeps live stock —and all should keep animals to the limit of the feeding and pasturing capacity of the farm—should have a silo because it is the cheapest and best feed producer on the farm.

Why are all Fords equipped with

Champion

Dependable Spark Plugs

Every Ford owner will find the answer in the Ford instruction book, which says:—

"The make of plugs with which Ford engines are equipped when they leave the factory are best adapted to the requirements of our motors."

Since 1911 Fords have been, and are now, "Champion" equipped.

For motor owners who have other makes of cars we have developed a type of spark plug to give that same unfailing dependability for which Ford motors are known.

You can place absolute confidence in Champion Spark Plugs to carry you through any emergency condition that your engine will stand up under.

The right plug has "Champion" on the insulator as well as on the box.

THE HORSE

FEEDING AND WATERING HORSES IN HOT WEATHER.

While it is wise at all times to exercise care and regularity in feeding horses that are used for either fast or slow work, it is especially so in very warm weather. The feed should be of the best quality and given in limited puantities. The quantity of bulky feed should be limited in all cases when time is limited, and the horses are expected to go to work or drive shortly after eating. The stomach of the horse being a comparatively small organ, the majority of horses will, if allowed, eat until it becomes distended. If an animal under such conditions be put to work on a hot day he will perspire freely, digestion is very liable to become partially arrested, and a case of acute indigestion may result. It is good practice to allow a horse to rest an hour or longer after eating a hearty meal in order that digestion may be advanced before exercise be given, but this is not practicable in many cases, especially on the farm. The only safe method, therefore, of avoiding danger of sickness, or, if not an attack of illness, at least discomfort to the animal for an hour or two, is to limit the quantity of bulky feeed given. The morning's feed should be from 4 to 6 quarts of oats, according to the size of the animal, and the nature of the work to be performed, and a small ration of hay; at noon the same. In the evening it is good practice to give a little hay first, then the grain ration, and then more hay. As he will have several hours of idleness now, it is safe to allow him all the hay he will eat with a relish, but in no case should he be allowed more than he will consume. It is not only wasteful but injurious to the animal to keep feed before him all the time. In many cases farm horses are turned out on grass at night, but it is seldom that they will refuse a reasonable grain ration in the morning, even after coming off good pasture. Where this method is followed, it is good practice to allow them to stand an hour or longer in the stable after eating their grain ration in the evening. (Of course, under such conditions no hay should be fed.) This allows the digestice juices of the stomach to at least partially perform their functions, and at least a portion of the contents of the stomach will have passed into the small intestine, where digestion will be completed; while, if the animals be turned on grass immediately after eating grain they may eat so greedily as to force the grain out of the stomach before the said juices have acted properly upon it. And, while it is not probable that this will cause any noticeable trouble or uneasiness to the animals, digestion will not be as complete as it should be, hence the animals will not receive as much benefit as otherwise.

There is no doubt that crushed or rolled oats are more beneficial, pound for pound, than whole oats. It is seldom, even in hot weather, that a horse is so warn that it is unsafe to feed him grain. In cases where he has been subjected to long-continued, severe exercise, and has become excessively hot, it is wise to allow him to stand for a few minutes, and to rub him down before feeding, but such conditions seldom occur. When the time that he will be allowed to stand in the stable is limited to from one to one and a half hours, as is the case at noon, even though the weather be hot and he is perspiring freely, it is better to give him his grain and allow him a few minutes after eating, than to allow him to cool off, then feed him, and put him to work immediately after eating. Horses that are kept in the stable should be given a feed of bran, at least twice weekly, in addition to the grain ration, if at regular work. This aids indigestion and tends to keep the bowels in a normal condition; but those that go to grass at night do not require this, as the grass is all that is needed.

In hot weather horses probably suffer more from an injudicious system of watering. It would be well if horses could have free access to clear, cold water at will, but of course this is impracticable. Still, the popular idea that it is unsafe to allow a horse to drink when he is perspiring freely, even in hot weather, is unfounded. Of course, as in feeding grain, there may be times when it would be hurtful to allow him all the cold water he would drink, such as cases where he has been subjected to long continued, severe exercise and long abstinence from watear. In such cases he should be allowed a few mouthfuls, and after a few minutes a litle more, and a few minutes afterwards, all he desires. When a horse is excessively warm the introduction into the stomach of large quantities of cold water may cause such violent reaction as to excite gastritis, indigestion or founder. It seldom occurs that a horse used for either ordinary farm or road work is so warm that it is not safe to allow him all the water he will drink, unless a long period has elapsed since he had a drink.

Many people act upon the theory that a horse should be allowed water only before meals, on the assumption that if allowed to drink soon after a meal the water will force the injesta out of the stomach before it has been acted upon by the digestive fluids. We doubt the force of this theory. We are of the opinion that fluids cannot force solids through a constricted orifice through which the injesta must pass to reach the intestine, but rather that it percolates through the solid particles and itself passes to the small intestine. In practice we find that

Paint Up Your Farm Buildings

Is the paint wearing thin? Is there some building, fence, bridge not painted yet?

Paint up! For protection, as well as for appearance.

"Save the Surface and You Save All"

Economy Ready Mixed House Paint

is the best for your farm dwelling, both inside and out.

It gives real protection against weather; preserves the wood and saves repairs.

It is scientifically made of pure materials, well ground and mixed

Sterling Shingle Stain

protects your roofs in the same way, with a waterproof, non-fadeable, attractive coating.

Longwear Barn Paint

Is the best for barns, bridges, fences, farm machinery, etc. Preserves wood and metal.

If your dealer hasn't got these paints and stains, send us the attached coupon with your name and address, and we will mail FREE our color card and price list.

horses want water after a meal, especially in hot weather, and that, with few exceptions, it is wise to allow them to quench their thirst. There are some horses so predisposed to colic that it is unsafe to allow water shortly after a meal; such should be treated accordingly, but fortunately such animals are few.

It is probable that the sense of thirst is as acute in a horse as in the teamster. When he is thirsty "he wants a drink," and usually manages to get one. The horse also "wants a drink" when he is thirsty, and the careful, thoughtful teamster will endeavor to see that he is gratified. It would be well if horses could be given at least one drink between meals in hot weather.—Whip, in Farmers' Advocate.

PREVENTIVE AND CURATIVE TREATMENT OF JOINT-ILL.

Joint-ill annually exacts a heavy toll from the foal crop in this Dominion. It is more severe some seasons than others, and is often quite prevalent in some districts and absent from others. The theory upon which the veterinary profession base treatment is that the germ gains entrance through some raw surface, particularly the navel, at time of birth or shortly after. It locates in the joints, multiplies rapidly and gives rise to characteristic symptoms. It was once thought that the disease could be contracted before birth, and was therefore congenital, but modern science does not recognize this as a fact. However, the horsemen at several famous British studs still cling to the belief that preventive measures against prebirth contraction of the disease are worth while, as the following excerpt from the Live-Stock Journal will indicate:

"A simple treatment adopted at the Carlton Stud of Messrs. James Forshaw and Sons, as a safeguard against joint-ill will save breeders many troubles with their foals. The treatment was adopted by the late James Forshaw, and has been consistently carried out ever since. When the foal is twelve hours old an injection is given of about a pint of warm water (about the temperature of milk when freshly drawn from the cow), to which a little soap has been added. The quantity of soap required is so small that it is sufficient to rub a little on the hands and wash it off in the watetr to be injected by an enema or rubber ball syringe, the latter being preferred. The whole of the liquid is slowly injected into the rectum. Even if there are signs of looseness or purging after this treatment the dose must be repeated in twenty-four hours.

"The reasons for the process are thus explained. Examinations of the young foal often revealed the presence of hard dung, which in many cases could not be discharged until dissolved by the soap solution. This obstruction retarded the cleansing process, and the system became poisoned. A second injection is given because even though the foal may have shown signs of looseness small, hard balls of dung have been found in the passage, and great importance is attached to thorough cleansing of the bowels. Without venturing any opinions as to the cause and cures of joint-ill, which are matters for the scientists who are engaged on research work, the fact remains that at Carlton there has not been a case of joint-ill for twenty years, and it is also important to know that the farmers in the districts surrounding the stud who have adopted the practice, have also ha da remarkable immunity from this trouble.

"Another simple form of preventive treatment is adopted in Messrs. H. and R. Ainscough's old-established Burscough Shire Stud, in which there are at present fifteen out of sixteen mares in foal. A few days before foaling time iodine of potassium (five grames to each meal) is mixed night and morning with the mare's feed, and this quantity is given every second or third day. For three or four days after foaling the same dose is supplied daily, and then every alternate day until the foal is eight or ten days old, after which time outbreaks of joint-ill are rare. In numerous cases on farms in the district a timely dose of iodide of potassium given to the dam —the foal gets the benefit through the mother's milk—has had the desired result."

Preventive Treatment.

If we accept the theory that infection occurs at or subsequent to birth, then it is obvious that measures should be taken to prevent the entrance of the germ into the system.

All dust, cobwebs, etc., should be swept out of the stable, and the stall in which the prospective foal is to be born, should be thoroughly and regularly cleaned, and it is good practice to scatter slaked lime on the floor each morning before providing fresh bedding. It is good practice to give the stall a thorough coat of hot lime wash with about 5 per cent. carbolic acid, or, if whitewash be objectionable give it a thorough scrubbing with hot water containing 5 per cent. of the acid. It is also good practice to wash the external genital organs, tail and hind quarters of the mare occasionally with an antiseptic and germicide, as a 5-per-ectn. solution of one of the coal-tar antiseptics or carbolic acid. When the mare is to foal on grass, of course, all these precautions cannot be taken, but there is little danger of the germ existing on grass, but it may be found in sand or clay devoid of grass. The most essential preventative measure that can be observed in all cases is local attention to the navel as soon as possible after birth, and several times daily afterwards until it dries up and is thoroughly healed. The breeder should have on hand a supply of strong antiseptic and germicide when his mare is about to foal. This may be a 10 per cent. solution of carbolic acid or one of the coal-tar antiseptics, tincture of iodine, or a solution of corrosive sublimate 30 to 40 grains to a pint of water. Whatever is used should be applied as soon as possible after birth and every few hours until the navel opening has healed.

Symptoms of Joint-ill.

The symptoms may become apparent soon after the infection enters the system. From a few hours to a few days, and in rare cases a few weeks after birth, the foal is noticed to be full, lies a great deal, and manifests

The Simplicity of a
MAXWELL
is Due to Special Steels

A MAXWELL is a simple car. Its engine, axles, clutch, transmission and gears are the utmost in simplicity, which is the goal of scientific engineering.

Special steels have made this possible. They are steels made to Maxwell's own formulae, the result of thousands of tests and years of analysis.

These steels give a Maxwell the remarkable combination of extra strength and lightness in weight.

In this way complicated construction has been avoided. Simple design has naturally followed and to this simplicity rare strength has been added by the use of these special steels.

Strains, twists, thrusts, shocks and blows are protected against in many other cars by reinforcements, extra weight in metals used, and a design that obviously is anything but simple.

In a Maxwell this simplicity has made the car easier to build, and it therefore is better built, easier to drive, and easier to care for.

That this should win friends for Maxwell is almost too obvious to call attention to.

Nearly 400,000 persons now drive a Maxwell, which is a very definite endorsement.

POULTRY.

HENHOUSE NEEDS TO BE WELL BUILT

A glance at about four out of every five farm poultry houses conveys the impression that the builder worked on the assumption that any sort of a box or shed would serve to house poultry.

The successful poultrymen will contend that as much attention should be given in the building of the poultry house toward making it comfortable for the birds as to make a dwelling comfortable for the people who are to inhabit the same. There are three main essentials for comfort that should be observed, namely, good ventilation, abundance of light, and absence of draft. Another essential which might be added is that of warmth. If, however, the three first mentioned essentials are looked after, this latter will be practically taken care of.

The question of the proper location is one that should be studied in order to take advantage of as many natural conditions as possible. A dry, well drained location should be selected which is well protected from the cold wintry winds, and should be open toward the south to admit of an abundance of sunlight. If a south front can be obtained it is preferable to any other. This, however, is not always possible. Some thought should also be given in the selection of the location to the arranging of ground for the poultry and also to the possibility of having the chickens about certain sections of the farmsteads, such as the feeding ground and the orchard.

After deciding upon the location of the poultry house the next important step is determining the size. This can only be done by taking into consideration the size of the flock or flocks to be kept. A good general rule is to allow from four to five square feet of floor space for each bird.

Foundation and Construction

A first class foundation should be constructed. It should be made eight or nine inches thick, about sixteen inches deep, and should extend six or eight inches above the surface of the ground. A concrete floor will give very good satisfaction and it may be placed immediately following the placing of the foundation. It is well to put a layer of three or four inches of cinders on the ground and then place a three or four-inch concrete floor on this layer of cinders. The cinders will tend to keep the floor dry, also prevent improper drainage so that any accumulation of moisture underneath will be readily carried away. Bolts should be placed in the foundation at six or eight-foot intervals to which the sills are fastened.

The frame work for the walls should be constructed of two by four-inch material. The outer walls should be constructed of a good grade of drop sidings, or in case a very substantial construction is desired, they may be constructed of sheeting and lapsing with a layer of building paper between the sheeting and the siding. Attention must be given while building the walls to the proper placing of windows. These windows should be arranged to open to admit of a greater circulation of air than will be obtained through the open ventilators at the top, in case it is desired. The proper way is to hinge these windows at the bottom allowing them to open in at the top.

The roof may be covered with shingles or prepared roofing. If it is rather flat, that is, less than one-fourth pitch, which means a rise of six inches for each foot in width, some form of prepared roofing should be used. The roof should be tight so that it will not leak during a rain. A plan that is sometimes followed is to place a ventilator at the rear of the roof which can be opened.

The roosts should be placed at the rear o fthe house and the wall and roof adjacent to the roost lined with flooring or ceiling boards to make a double wall with an air space between the roost and the outer wall and the roof directly above. This will tend to keep the cold walls from chilling the birds and will also prevent an accum-

They Satisfy

Pure Air is as Necessary as Pure Food

THE ENTERPRISE BLAZER FURNACE heats your home in Nature's way. It draws in the sweet pure air from the big outdoors, moistens it thoroughly, turns it into heat and comfort and passes it on to every corner of your home.

The best that base burners and radiators can do is to heat the air that is already in the house—that has been breathed again and again. Stoves choke the air with dust and in real cold weather they fall short of their job. Another reason for the

ENTERPRISE BLAZER WARM AIR FURNACE

is economy. For thirty-five years we have been learning how to take all the heat out of a piece of coal; and then how to make most use of it. The Enterprise Blazer is the result. And it costs a great deal less to install than a hot water boiler, pipes and radiators.

Health and Comfort →

An Enterprise Blazer will wear for years and years. Every part is made a little better than it need be, and it carries the famous Enterprise guarantee of satisfaction. Get your dealer's advice and write us today for our free booklet "Warmth and Comfort".

The Enterprise Foundry Co.
Limited
SACKVILLE, N. B. 21
Makers of the well-known lines of Enterprise Stoves, Ranges and Furnaces

ulation of moisture through condensation on the walls.

All feed hoppers and water pans should be placed about 18 inches above the floor. The reason for this is that the entire floor space can be used as a scratching area or space. In this way the need for the separate scratching shed can be overcome. O. W. S.

PLAN TO TRY A FEW TURKEYS.

People should know by this time that the raising of turkeys offers a chance to make some very good moneyp in connection with the general farm poultry work. The reason for the high prices which prevailed the past holiday season is due entirely to a lack of sufficient production to meet the demand.

Turkey raising has always been looked upon as a hard trick to learn, due to a popular myth to the effect that the turkey is a delicate fowl which can seldom be brought through the various stages to maturity.

I for one know that the turkey is not a delicate fowl, that it can be raised on any farm in the country successfully and at a good profit. It is true that the turkey differs materially from any other fowl and often does not thrive, largely because the farmer has tried to apply principles applicable to other fowls to it, which will seldom succeed. The turkey is a bird of a nature all its own. As soon as you learn that nature, and cater to it, you will find yourself raising turkeys successfully with less effort than your brood of chicks require and with no greater losses.

Turkey hens do their laying generally in April. The eggs are gathered often in order to prevent chilling and are preferably set under hens, although they may be hatched in any good incubator. Unless you are an experienced incubator operator it is best not to experiment, as the turkey eggs are too valuable for this.

The eggs hatch in four weeks. It is best not to set the turkey hens but to induce them to lay a second clutch of eggs in order to incubate that many more. One hen may be allowed to set in order that she can brood or lead the whole flock of youngsters.

Now comes the most important period of the young turk's life. Keep the youngsters, or the mother heh, penned up until the turks are large enough to follow her afield. Each morning turn them out to range after the dew has gone off the grass. Drive them back into their enclosure for a few nights until they learn to come in to roost.

As to feeding the young turks, use some judgment. Nature does not start the young turks out on sloppy foods especially cornmeal. It is better to feed clean, whole grains, dried bread crumbs, ordinary chick food will answer the need admirably, until the turks can be allowed free range.

Where they have a free range all their own, especially through a wooded tract they will require absolutely no feeding whatever throughout the growing season, although they may be topped off later in the summer on corn in order to fatten them up quickly for the early holidays.

The nice thing about turkey raising is that the attention they require comes early in the season, doesn't last more than two or three weeks, and then they shift for themselves. The feed they eat costs nothing, so that they are almost pure "velvet." Try a few this season.

DEPENDABLE HENS FOR BREEDING.

Eggs from the poorest layers art generally used for hatching on the farms. Hens though not particularly good layers will lay in the spring and early summer, and the eggs from these are the ones likely to be taken for hatching.

No hen is a really good layer unless she lays during the winter. In the nature of things a hen must lay in winter in order to produce eggs enough in a year to take even moderately high rank. If the poultry owner would take the precaution to mark the hens which lay in winter so they could be selected to produce the eggs used in hatching in the spring a great improvement in laying ability would take place at once, no matter what kinds of hens were being kept. There are good layers among the veriest scrub hens. One of the best layers we ever owned was a nondescript hen, one of a half-dozen picked up in market and selected because their breeding was so mixed that no idea could be had by looking at them how many different varieties were represented in their blood lines. The hens were selected, to be trapnested in order to prove a theiry which this particular hen emphatically negatived. Anyone who gets on familiar terms with his hens, an easy thing to do in winter, willl be able to determine which hens are laying during the cold months. We put an extra leg brand on such hens, noting the number in a book. This gives us a line on the winter layers, the ones we want to breed from.

Under ordinary farm practice these hens go unmarked. As they have been laying through the winter they go broody earlier than the hens that have loafed during the winter, and as early chicks are always desired these best layers are used as sitters and the eggs put under them are those produced by the hens that did not lay until hatching time in the spring. Thus eggs from the poorest layers are used for hatching and the laying ability of the flock is impaired instead of being augmented. The result of this method is that the average annual egg production of the hens of this country is seven dozen instead of twelve which ought to be the average and would be if the eggs from winter layers were used for hatching. Setting the hens that go broody early in the spring is unprofitable. They should be broken up and when they begin laying again their eggs used for the spring crop of chicks.

MILLER PURVIS.

LATE CHICKENS NEED GOOD CARE.

Like everything else this spring, the hatching of chickens is three or four weeks late, and in order to have the required number of chicks, hatching must be continued later than usual. This later or delayed hatching necessarily means that the chicks will have to get first class care and feed if they are to develop and mature before cold weather comes in the fall.

May and the first half of June is not too late to hatch chickens, according to Professor Herner, of the M.A.C. Poultry Department, providing the chicks get proper attention. Care and feed have just as much to do with growth and development of chicks as date of hatching, and it is quite possible to take what are called late chickens and make out of them really good winter layers.

These late chickens should be given a variety of feed. Cracked wheat, wheat screenings, pin head or granulated oatmeal, combined or fed separately, make excellent hard grain feed for them. In addition, chickens should be fed all they can eat of some dry mash. Fine oat chop and shorts make a good mash and should be available for chicks from the time they are a day or two old till they are full grown. Buttermilk or skim milk and a good range of green grass also helpp the chickens to grow.

WHITEWASH FOR THE HEN HOUSE.

When everything else around the farm is being cleaned and put in shape for the summer, a coat of whitewash will add greatly to the appearance and sanitation of the interior of the poultry house. It is the cheapest of all paints and may be used on the exterior of the building, too, if desired.

Whitewash is made by slacking about ten pounds of quicklime in a pail with two gallons of water, covering the pail wtih cloth or burlap and allowing it to slake for one hour. Water is then added to bring the whitewash to a consistency which may be applied readily.

A weatherproof whitewash for exterior surfaces may be made as follows: (1) Slake one bushel of quicklime in twelve gallons of hot water; (2) dissolve two pounds of common salt and one pound of sulphate of zinc in two gallons of boiling water; pour (2) into (1), then add two gallons of skim milk, and mix thoroughly. Whitewash is spread lightly over the surface with a broad brush.

Without sufficient acilities for taking care of implements, vehicles, machinery and other equipment, there may be such a loss that the owner cannot maintain the fertility of his soil.

For horses that gnaw wood a remedy is to keep all wooden corners within reach smeared with crude oil.

Remington UMC
Are You Still "Guessing" About Your Shells?
If you are, change over to Remington UMC "Arrow" or "Nitro Club," the famous wetproof shells, and note the improvement that takes place. All guesswork is eliminated when you use these sure-fire shellls. Their speed, penetration, and uniform pattern make them the favorite shell for sportsmen who know.

B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

"A LITTLE CHILD"

Abby Cooper was thinning out her poppy bed. She thought there were poppies enough to supply the whole town, and they were a very special kind, too.

From the next house an old woman came out and stood for a moment watching Abby. She had a gentle, time-worn face. As though acting under strong resolution, she stepped off the porch and approached the line fence. "What you doing, Abby? Weeding " she asked.

Abby did not look up. She answered with a single word so like a grunt that no one could have recognized it as "No."

The other woman continued to watch her. Finally she stooped, and squeezing through a broken place in the fence came close to Abby's side.

"Oh!" she remarked. "You're thinning out your poppies. My, you're pulling up an awful lot of 'em, ain't you?"

Abby grunted agani.

Mrs. Briggs picked up a handful of the discarded plants. "I guess I'll take these home wtih me, seeing you've no use for them," she said.

Abby got up quickly. Something lit in her face that was not pleasant to see. She caught the plants from the other woman's hands and tore them into bits.

"Abby!" Mrs. Briggs cried, aghast. "It wouldn't hurt you to let me have just two or three."

"I don't know whethre 'twould hurt me or not," Abby replied coldly. "I've never given any away to find out. And, what's more, shan't ever give any away. My grandmother never did, nor my own mother. There ain't another poppy like these in the whole town, and I don't mean there ever shall be. They're one thing I've got that other folks haven't, and I shall be just as stingy with 'em as I choose."

Mrs. Briggs looked at her between tears and anger. She had wanted some of those poppies for years and Abby's outspoken meanness affected her scarcely less than her own disappoinmtnet at not getting her heart's desire. "I wouldn't do a thing like that to noboby," she said, when she could speak. "I should think you'd be ashamed. I should think you'd just despise yourself. 'Tisn't poppies alone. It's everything. You're mean all the way through. Everybody says so. I say so. You're the first woman I ever lived by that I couldn't neighbor with. I've done my last of trying to be nice to you. I don't want anything more to do with you." She turned and went away, leaving Abby alone with her poppies.

Abby knelt again and began to tear up the unnecessary plants, but now there was a kind of violence in her touch. Her cheeks had reddened. "I don't care; I don't care," she kept muttering over and over. When she had finished the work she took the discarded plants to the refuse heap and set fire to them. "There," she said, "if they get any of my poppies now they'll have to steal 'em, and then they'll be meaner than I am."

Abby stood raking down the burning heap that the last poppy might be consumed when she heard her name spoken. Because it was a man's voice, and therefore unusual on her premises, she turned quickly. The man who stood there was about her own age, but he looked younger in spite of the dust of a waggon journey. Abby had known him all her life. For 20 years quite regularly, winter and summer, he had driven the Sharruck stage past her door.

"I got a passenger for you, Abby," he said. "Out there in the stage." He made a motion of the head. "Burning up your love lettters, Abby?"

"No. I never had any to burn up."

"I didn't know, but George Wallace used to write to you them days he was shining round you."

Abby did not speak.

"I suppose you knew he was dead?"

"I saw it in the paper."

"Well, his wife's dead, too. They left a youngster."

"What of it?" Abby's eyes snapped. "It's nothing to me."

"I don't know about that. Wouldn't you take a present if one was offered you, Abby "

Abby raked the little heap of dying fire ruthlessly. "As far as I can see," she remarked, "there isn't a mite of sense in what you're saying."

"Now, there you're off, Abby," said the stage driver. "There's a lot of sense in what I'm saying. I never was one to tell all I knew in a minute. That child of George's was left between two people, according to his dying wish. One of them people was his cousin, Olivia Hawkins, at Sharruck. But Olivia's got that there tuberculosis they talk so much about. 'Twarn't fitten for the child to stay there. So I've brought her to you."

"To me!" The rake dropped from Abby's hand.

The stage driver nodded. "She's out there in the stage now. She's the present I spoke of. You got to take she 'cause she's delivered. Besides," and here the stage driver attained a height of dignity that was really commanding. "Abby, a dying man's wish is not to be disregarded. You'd have married George Wallace if he'd a had you. Maybe he regretted he hadn't. From what I hear his wife wasn't much comfort to him. Anyhow, he left you his little girl. That shows he put a lot of confidence in you, Abby, and don't you betray it." He waited. Abby continued to make dabs at the ashes with her rake. She did not speak, but her voice had softened.

"Come out to the stage and see Bessie," the man said.

He turned away and Abby followed. In the front seat sat a little girl of five in a shrunken blue cap and coat. She turned blue eyes upon the stage driver and smiled. "I told you to watch the horses while I was gone, and you did, didn't you, Bessie?" asked the stage driver. "She's a pretty good girl, I guess. My woman says so. She kept her last night, after she came, because she couldn't go back to Olivia's, of course. I'd like to take her back with me, I would so."

"Why don't you " Abby returned.

"Because," said the stage driver sternly, "I've got seven at home, and staging it ain't what it was, and it's your place to take her, anyway."

"Iift her down," Abby said.

The stage driver lifted the child out tenderly. "You've got to auntie's house now," he said gently. "Auntie'll take good care of you if you're a good girl. You will be, won't you?" He stooped and looked into the blue eyes. Bessie nodded solemnly. Then with great sweetness he kissed her and put her hand in Abby's. "I ain't no great hand at quoting scripture," he said, with a catch in his voice, "but there's one passage kinda comes to my mind now—about a little child shall lead them. Maybe you know which one that is, Abby? Well, good-by. This ain't earning any victuals for my babies." He climbed into the muddy old stage and drove away.

Abby was left with the child clinging to her hand. It was a curious situation for an old maid past middle age who was unloved, unloving, lonely and addicted to her own selfish ways of living. She felt singularly embarrassed by the little form beside her . The way the child looked up at her, the touch of the soft little hand stirred her strangely. She never had any children about her and her own childhood was long since unremembered. Even those far away days when the child's father had come so near to proposing to her and never had were dreamily indistinct. She had heard that he said he would have married her but for her selfish, miserly nature. So near had she come to happiness. And now out of that dim old dream had come this little blue-eyed child.

"I'm glad I've come to live with you, auntie," Bessie said trustingly. "I like your house. Have you got a kitty?"

"No, I haven't got a kitty."

"Nor a dog? Nor any little boys and girls?"

"Nobody but you."

"We'll have to love each other a lot then, won't we " Bessie asked.

"We'll—try to," gulped Abby. She led the child in doors.

"My, it's awful nice here, ain't it, auntie?" Bessie exclaimed as she looked about.

"It might be nicer, I guess," Abby replied.

"I think it's nice," the child said conclusively.

To herself Abby was saying: "What shall I do It isn't nice here, yet she seems to think so. She's got such innocent eyes. Why she—she seems to believe that I'm going to do what's right by her, she actually does."

Bessie was the most unself-conscious and friendly of children. She prattled to Abby as unrestrainedly as though she had been in the woman's keeping for months instead of moments. She brought a fresh delight to everything. "What booful flowers!" she murmured.

"Mustn't touch," Abby warned.

"I wasn't going to," Bessie rejoined quickly. "I never touch things less I'm given p'mission."

At the supper table Abby filled Bessie's plate before her own, but the child dod not eat. "What's the matter? Ain't you hungry?" Abby asked.

Bessie nodded emphatically. "But you haven't said thinks for this our daily bread."

"My goodness!" though Abby. She flushed scarlet. Then hastily bowing her head she mumbled an old form that she remembered her father had used. After that the meal went very well.

The child had no clothing. There had been a satchelful, she told Abby, but It had got lost on the way. That night, after she had bathed, she slept in one of Abby's nightgowns. Abby nerself scarcely slept at all; her mind was too full of problems.

Next morning Abby went to the store with Bessie trotting beside her. At the counter she asked to look at brown check gingham, but the child pointed to the shelf where were pieces of delicate pinks and blues.

"I like those," she remarked calmly.

So Abby bought pink and blue instead of the ugly brown. She bought other things, too, a great many of them—in which Bessie's choice somehow dominated her own. In fact, she was astonished at the sum of money she spent for needs that were not selfishly her own.

On the way home she met Mrs. Mackin, leading her little daughter. Abby had not spoken to Mrs. Macklin for a long time, but she had to speak now, for Bessie and Margaret recognized in each other kiss-mates.

"I love you," Bessie said to Margaret as they embraced.

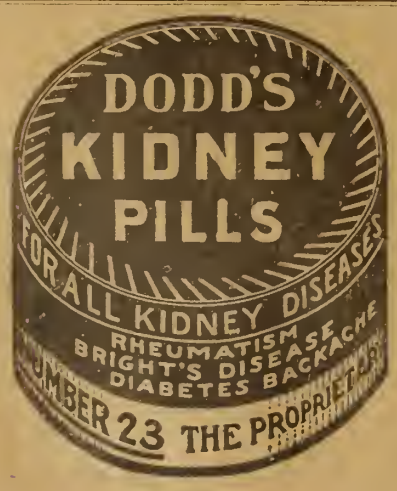
"What little girl is that?" Mrs. Macklin asked.

"She's my little girl," Abby answered.

"Your—— Why, what in the world do you mean?"

Abby explained.

"I remember George," Mrs. Macklin said. "So he's dead? Poor fellow! It's a very sweet face his child's got.



McClary's

Make good stoves and Cooking utensils.

Do Not Neglect The Bad Cold OF TO-DAY

IT MAY BE SERIOUS TO-MORROW

May Develop Into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont., writes:—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

I imagine, Abby, you'll find it something of a trial to bring up a child. If you ever need advice or anything come to me. And, Abby, she'll need other children to play with. Let her come to see Margaret sometimes."

Abby found herself trying to sing as she stitched away, making clothes for the child. The house was becoming quite a different place these days. Everybody knew there was a child in it, and everybody was trying to do something for her out of pity. Mrs. Macklin sent picture books, Mrs. Morse gave some of Teddy's old toys, and Mrs. Grant begged Abby to accept almost a complete wardrobe which the Grant twins had outgrown. It was impossible to refuse. Abby had tried once to refuse a gift when Bessie was by and the child's awe struck into her calloused heart.

Bessie's friends sprang up everywhere. She was sunshine, flowers, music, wherever she went. The stage-driver brought her gifts from his children, even Mrs. Briggs unbent so far as to send a loaf of her famous graham bread—"It'll be so good for Bessie," she said.

Gradually Abby herself felt the beneficence of that generous, loving little heart beating so closely beside her own.

"You're growing pretty, auntie," Bessie said one day as she smoothed Abby's cheek. "You smile so nice now. And the wrinkles are going away."

"Do you love me. Bessie " Abby pleaded. It was becoming as necessary to her as her daily bread to have Bessie love her. And when the child hugged her close and cuddled in to her shoulder, Abby felt the meanness and selfishness that had dwarfed her life going out of her poor soul forever.

It was the following summer that Abby began to find that the whole town seemed to be sown with poppies from her bed. Mrs. Briggs had them and Mrs. Macklin had them and Miss Jones had them. Then she understood. Bessie had gathered the seed to start a bed for herself, as Abby's mother had taugh her to do when she was Bessie's age. But instead of keeping the seed, she had given it away.

"You said it was to be my very own," she explained when Abby questioned her. "And when a thing's your own you don't have to ask what you shall do with it, do you? I wanted to give something back for the toys and things. You don't care, do you, auntie "

"No," Abby replied. "I don't care." And, strange to say, she didn't.

Good for Father and Good for Son

MR. C. ROY PRAISES DODD'S KIDNEY PILLS.

He States That They Relieved His Son of Bed Wetting and Himself of Bladder Trouble—Ask Your Neighbors About Dodd's Kidney Pills.

Thivierge Office, Bonaventure Co., Que., August 6th—(Special)—That Dodd's Kidney Pills have been successfully used by both old and young as a remedy for kidney ills is again shown by the statement of Mr. Clement Roy, of this place.

"I am glad to be able to state," Mr. Roy says, "that Dodd's Kidney Pills relieved my little boy of bed wetting. They also helped my bladder trouble. I cannot say too much in praise of Dodd's Kidney Pills."

Dodd's Kidney Pills are a kidney remedy pure and simple. But bladdder and urinary troubles come as a result of weak or diseased kidneys. The natural way to treat such troubles is to strengthen or help the kidneys.

Mr. Roy acted on this principle when he used Dodd's Kidney Pills for his own and his son's troubles. The satisfaction he got is voiced by his statement.

If you have not used them yourself ask your neighbors if Dodd's Kidney Pills are not the remedy for kidney ills.

WARM WEATHER DESSERTS.

Heavy desserts are being eliminated gradually from the family menu. Housekeepers are realizing that, although not an entirely superfluous course, as some people who have no sweet tooth would have us believe, the real purpose of the dessert is merely to put a period to the meal.

For this reason its preparation demands more than a passing thought. Its mission is two-fold: it must be of such a nature that, for the time being, nothing is left to be desired. At the same time it must furnish the gastronomic motif which will stimulate the flagging appetite in order that in its turn the dessert may be relished.

It is particularly true in summer time, when dainty desserts that appeal to the eye will also tempt the appetite. A great many housekeepers have a notion that ice cream is an expensive and troublesome dessert.

Frozen Dainities.

On the contrary, almost all frozen mixtures are much cheaper than pies, puddings, and similar sweets; and with a modern freezer, of a size suited to the family needs, the freezing process is so simple that even the bugbear of extra work is removed. Indeed if time enough for self-freezing is allowed, no labor, save the packing down in ice and salt, is entailed.

The following frozen dainty will appeal to those who have an eye as well as a cultivated taste for food harmony:

zDry-whip a quart of thick, sweet cream and add sugar to make quite sweet, as freezing extracts the sweetness as well as the flavor from any mixture. Chop a cupful of maraschine cherries very fine, then add them togther with their liquor to the cream. Turn the mixture into a mold, cover closely and bind around the opening wtih a strip of buttered muslin to prevent any salt from finding its way inside. Bury in crushed ice and salt for six hours. Dish for individual serving, masking each serving with whipped cream and garnishing it with split, blanched almonds.

The St. Lawrence Flour Mills Co. LIMITED
Montreal, P.Q. Halifax, N.S.

Sponge Cake Transformations.

Spongecake, fresh or stale, is always stock in trade to the housewife of resourceful mind. Serve with a mask of custard, rich fruit sauce or whipped cream, it is transformed from an uninteresting slice of cake into a culinery joy.

Another spongecake transformation, not so familiar but most certainly worthy of a more intimate acquaintance, is wrought as follows: Cut thin horizontal slices of the cake; then spread each slice with chopped and sweetened fruit or with preserves. Pile the slices one on top of the other, layer cake fashion, and cover the whole with a kind of white icing which, though it hardens on the surface, is soft in consistency underneath. Cut into square and eat with a fork.

Rhubarb Lemonade.

Cut into large pieces a bunch of rhubarb, and after covering with three pints of cold water cook for twenty minutes. Add in order mentioned: one pound granulated sugar, ½ shredded pineapple, one thinly sliced lime, ½ glass orange juice, and one cup maraschino cherries. Stir the fruit puree until the sugar is entirely dissolved and when very cold pour in one pint of Vinchy water. Serve from a high tankard into stemmed goblets with long handled spoons so that the fruit may be eaten.

Strawberry Ambrosia.

This delicious beverage, which is as delectable to the eye as to the palate, is prepared by removing the milk from a large, fresh cocoanut and placing it where it will become very cold. Press through a sieve a quart of strawberries (reserving a few of the largest for decorative purposes). Add to these a small cup of sugar, confectioner's, and place directly on the ice.

At serving time add to the fruit the merest pinch of baking soda, one cup of stiffly whipped cheam, the cocoanut milk, and sufficient iced milk to form three pints of liquid. Serve in a high glass pitcher in which has been placed a cup of shaved ice and pour into small spiral glasses, garnishing with large, luscious strawberries.

Cocoanut Timbales.

In a double boiler cook together two cups of milk, three tablespoonfuls of corn starch, and sugar to taste. When smooth and thick remove from the fire, add the stiffly whipped whites of two eggs and one cup of grated cocoanut, pour into timbale moulds. Garnish with bright dots of jelly and blanched almonds, and serve with either carmel or chocolate sauce. Served in this way cocoanut is especially delicious.

Custard Desserts.

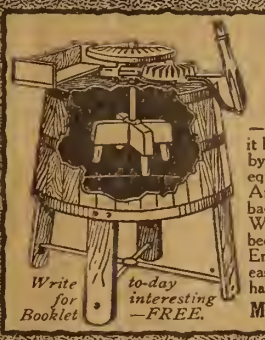
Given a smooth rich custard as a basis, nuumbers of delicious and attractive desserts are possible. Nuts of any kind but especially blanched almonds, ground fine, then added to the custard, and the mixture frozen is all it promises to be n the way of a palatable delight. To serve, heap high in sherbet glasses and garnish with English wanut meats.

Another custard variation is the following: Dip macaroons into dissolved gelatine that has been strained; then let them become slightly congealed. Put together to form a cup standing together in a pretty fruit saucer. Stand on ice until thoroughly set, then fill each cup with custard and garnish with whipped cream or chocolate meringue.

Any of the succulent fruits may be cut small and added to the custard, provided the latter is quite cold bebore the fruit is stirred in; otherwise there is danger of curdling. Fruit custard is a most acceptable change. A garnish of whipped cream is always a pleasing touch to any custard dish, also stiffly beaten egg whites.

Almond Souffle.

Make a soft custard using the yolks of two eggs, 1½ cups of milk, 2 tablespoons of sugar. Into this stir ½ cup of chopped dates, and one tablespoon of finely cut alronds. Drop a spoonful of this mixture in the bottom of butered ramekins, heap them with stiffly beaten egg whites that have been sweetened and flavored with almond extract, decorate with whole blanched almonds and candied violets. Place in moderate oven until nicely puffed and browned, serve immediately with whipped cream.



Maxwell
"Home" Washer

—the washer that not only washes the clothes mechanically, but does it better than they can be washed by hand. There's no "skimping" by the "Home" Washer—light or heavy articles are cleaned with equal thoroughness. There's no tearing of delicate fabrics, either And it does the work in half the time! No more long-drawn-out, backbreaking washdays anywhere there's a Maxwell "Home" Washer; Just put the clothes in, and the rest is hardly work at all—because the "Home" Washer is so light, noiseless, and easy-running. Enclosed gears make it absolutely safe: "springs" make cover lift easily. Made of best quality cypress, handsomely finished. Runs by hand-power or water-motor. See it at your dealer's.

MAXWELLS LIMITED, Dept. X St Marys, Ont. 34

SAFE WATER FOR THE DAIRY.

(Continued from page 819.)

inspection of the premises will invariably remove all uncertainty. Safe water for the dairy is essential—quite as much as in the afrm home. Milk is an ideal carrier of germs. An unsafe water supply used in the milk house is certain to result in contamination of the product sent forth.

PREVENTIVE AND CURATIVE TREATMENT OF JOINT-ILL.

(Continued from page 831.)

lameness or stiffness in one or more limbs. An examination usually reveals a swelling, heat and tenderness of one or more joints, often in the hocks or knees, but it may be the stifle, hip, elbow, shoulder, fetlock or pastern. Any joint or joints may be affected. The trouble is often thought to have been caused by the dam treading upon the foal, or by injury in other ways. The symptoms increase in intensity, sometimes quick, ly, in others more slowly. The swellings increase in size and soreness, the patient becomes weaker, less able to move, and lies most of the time. If helped to his feet he goes lame and sore, but in some cases will nurse fairly well, but soon lies down again. As the symptoms increase in intensity the general debility also increases, and the desire for or the ability to take nourishment diminishes. The joint or joints involved become puffy, and if they burst or are lanced a muddy-colored liquid escapes. In many cases the articular cartilages of the joint become destroyed. In these cases manipulation of the joint reveals a grating sound, caused by the ends of the bones rubbing against each other. When this stage has been reached it is a humane act to destroy the patient, as, though it is possible in some cases to preserve life by careful nursing and attention, the animal will always be a cripple.

Curative Treatment.

When a foal once contracts joint-ill its chances for complete recovery are not good, but success sometimes crowns one's efforts when treatment is persevered in. We cannot do better under this head than to reproduce the treatment recommened in the columns of the Farmers' Advocate, which is as follows:

Curative treatment is often effective when given early. The use of serums and anti-toxins especially prepared for the purpose, and which can be administered only by a veterinarian, has been reasonably successful both as a preventive and cure, hence it is wise for a breeder to employ a veterinarian as soon as possible after the first symptoms are noticed. Even amateur treatment may occasionally be successful. It consists in bathing the joints long and often with hot water, and after bathing rubbing well with a camphorated liniment as one made of ½ oz. tincture of iodine, 2 drams gum camphor, 4 oz. extract of witch hazel and alcohol to make a pint. The foal should be given 5 to 10 grains (according to class and size) of iodide of potassium in a little of the dam's milk three times daily, and it should be helped to nurse at least every hour if not able to nurse without help. The mare should be well fed on milk-producing feed, as bran, rolled oats, good hay, raw roots or grass if procurable, and should be given 1 to 1½ drams iodide of potassium 3 times daily. Such treatment may be successful in arresting the ravages of the germ and destroying those present. When the disease has reached that stage where abscesses are formed they should be lanced, and cavities flushed out well three times daily with a 5 per cent. solution of carbolic acid. When the articular cartilages have been destroyed and the bones can be heard or felt grating against each other, the patient should be destroyed.

A VITAL SPOT IN FARMING

Is the Boy Interested?

The other day the writer was passing a farm when he saw a young lad out plowing in the field. He was the son of the farmer who owned the land the lad was plowing. When asked what he got for wages for his labor, he bluntly answered: "Get? Why, nothing if I do, but a scolding if I don't."

This answer presents an interesting side light on the business end of farming as it is conducted on the average farm. It presents a feature of rural life that touches the vital spot in agriculture. It shows clearly that all efforts of Governmets or Departments of Education will answer no valuable purpose without the co-operation of the parents on the farm. Only the home and the home folks on the farm can settle the disinterestedness of the young people in rural industries, a problem that meantime is being ignorantly laid at the charge of education and legislation. Education and legislation are only the secondary means to the end; the business end of farming as it is conducted at the farm home is the primary element in guiding the destinies of a country's agriculture. Any one who has known and watched boys and girls at work on the farm, has seen what miracle the right sort of encouragement works in young people's nature.

To be happy and contented, a healthy, vigorous boy must have some sort of purpose or interest in life, the same as a man. He must work to an end. He must accomplish something for himself. A parent can command him to work from boyhood to manhood for his board and clothes and he will render service, grudgingly or otherwise, until prompted by his unsatisfied boyish longing to plan and do something for himself, to achieve some results with benefit to himself, he will either jump at the first opportunity to escape from so humdrum an existence, and leave the place. And once he goes it is not likely that he will ever again go back to the farm. He is not to blame for this feeling, in fact it is to his credit; it is proof of the good sutff in him, though the chances are he is making a great mistake.

Guiding the Boy's Budding Ability

There is just one sort of encouragement that will get him over this perilous stage of his development, and that is to give him a personal interest in his work. Give him something to do beside simply obeying orders and something to handle and manage on the farm in his own way. While he is yet young and unable to grasp the farm management in its wider field of business, give him an animal or some side line of the farm, and put him on his metal for the outcome or the income. As he ripens in years give him a substantial or personal share or partnership. Do this and you will succeed in the measure in which you are successful in awakening his interest and arousing his sense of responsibility, and eventually you will find your boy rising surprisingly to your expectations.

Should there be a family of boys this practical interest can be specialized in different lines. What will enthuse one boy will not enthuse another; boys' like, faculties and interests differ. The lad who is good with live stock will have more interest and better success in that branch of farming than he will have in the field, and the boy who has a fancy for fruit raising or likes to see things grow, naturally will do better in that direction. Boys should be encouraged to follow their bents and develop the faculties that rise to the surface in them. The wise father will acquaint himself with these faculties in his boys, and will encourage them to bring out their ideas. He will encourage them to plan and experiment for themselves, and in giving each of

them dominion over, and an interest in something on the farm suited to their budding abilities, or some part of farm work. Every farmer should be on friendly terms of comradeship with his sons, making each boy a sort of manager of his end of the farm and giving him a financial interest, so as to encourage the boy to advance his ideas.

Should any boy show a distinctive faculty as a trader or bookkeeper, let him put the farm into a business shape, by keeping accounts and records, and draw statements at the end of the season whereby much interest and direct value will be learned.

As a general rule there is a great lack of interest taken by many farmers, whose chief outlook apparently is to make as much as they can by robbing the soil and retire with the spoil at the earliest possible date. There are many who retire to town when their children are yet young. They make the excuse that it is for the sake of their children's education. The parents in all these cases seek to throw the whole responsibility of educating their children on the school teacher, and are shirking their own duty in training the child's mind and are robbing their children of their best chance in life. Parents that heedlessly take their children away from the farm are depriving them of a valuable heirloom in health of body and mind. The men who guide successful business enterprises in the city or country make it the chief part of that business for their sons to follow in their footsteps and the family name becomes a business principle. In like manner real success in the rural industry cannot come by any other means than by encouragement of the boys on the farm by friendly terms of comradeship and partnership with their parents.—Ottawa Farm Journal.

THE PRESENT COST AND SELLING PRICE OF HOGS

(Experimental Farms Note)

When a man states that there is no money in hogs he bases his contention largely on more or less accurate records of feeding costs, and feeding costs only. If the market hog cannot even pay for his feed, what then of interest on investment, labour, risk, losses, marketing expenses, etc., etc.?

The feed cost to produce one hundred pounds of pork may be calculated by including the cost of maintenance of the breeding stock responsible for the market hogs. Applying this method, one hundred pounds of pork would require about 600 pounds of meal. American farm survey figures indicate even a higher meal cost,—615 pounds. Valuing meal and grain at $70.00 per ton which is conservative enough, the herd feeding charges per hundred pounds of pork would amount to $21.00 on the 6 to 1 basis. Even this does not cover all farm costs.

Figures available from herds on the Experimental Farm System compare very closely with those obtained in farm survey reports i. e., that approximately 78% of the cost of pork production is for feeds and the remaining 22% to cover farm costs exclusive of shipping charges. To produce 100 pounds of pork under average Canadian conditions requires from 450 to 500 pounds of grain or the equivalent. At $70.00 per ton for meal this would represent a feed cost per cwt. of pork of $16.62 which figure represents only 78% of the total cost. One hundred per cent. or the feed plus the farm charge would amount to $21.28 per cwt.

The above figure may appear startling. There are hundreds of small feeders who can feed a litter or so of pigs on a much cheaper basis. Otherwise there would be very little pork produced. Why can a few hogs be raised comparatively cheaply on the farm? Simply because of the fact that a considerable proportion of the feed is in the nature of a by-product or perhaps home-grown. Multiply the swine activities on the farm and it is necessary to purchase more meal and grain at market prices. The cost to produce mounts alarmingly. So with the farm flock of poultry.

What shall we feed hogs? Grain, mill feeds and by product feeds are becoming scarcer than ever. Wheat by-products are practically off the market. The feed markets of the future are most discouraging in prospect. The wholesale price of hogs has not appreciated correspondingly. The man who can feed hogs profitably today must have a comparatively cheap product or by-product to replace meal as largely as possible. Such are scarce. Milk products form the greatest of all. City and hotel refuse is another. Green feed intelligently used, soiled or under the right conditions, pastured—is a third. Barley is one of the best of Canadian hog feeds—too little appreciated. Elevator screenings, if of standard quality, must be utilized wherever available. The man who is raising young pigs, who plans to feed them almost entirely on a grain ration, who has little or no milk or grain feed available, will almost certainly be forced to place a high valuation on manure and experience if he is to get an even break next fall.—G. B. Rothwell, Dominion Animal Husbandman.

BANKING CO-OPERATION

FARMERS will find it to their advantage to co-operate with this Bank.

With branches throughout every province of Canada, and correspondents in all parts of the world, we have unequalled facilities for gathering news of markets, prices, and business conditions of interest to farmers.

Make it a point to call upon us whenever you have an opportunity.

Mutual confidence brings success.

TOMATO ROT AND BORDEAUX MIXTURE

What is the reason that my tomatoes last year rotted on the stems as soon as they commenced to ripen?

What is Bordeaux mixture made from? D. F.

Ans: Anthracnose or ripe rot in tomatoes is greatly favored by damp, rainy weather. It is more prevalent in varieties that grow on heavy, close vines. When gathering up the first pickings instead of leaving the diseased fruits on the ground they should be placed in a separate basket, and burned. Spraying will not control it. Thorough cultivation and change of land will help to control the disease.

Bordeaux mixture is made from copper sulphate and lime in the following proportions, four pounds of copper sulphate, four pounds of lime, and 40 gallons of water. The way to prepare it is to get a barrel that will hold 40 gallons and two tubs that will hold 20 gallons each. Arrange the tubs so that one is on each side of the barrel. Dissolve the copper sulphate in hot water and dilute it to 20 gallons with cold water in one tub. In the other tub carefully slake four pounds of lime using only sufficient hot water to have the lime slaked in the form of a thick paste, in which form it should be allowed to cool. When cold, dilute to 20 gallons with cold water. The copper sulphate and milk of lime are now ready to mix, two persons being necessary for the operation. Have the contents of each tub well stirred; then pour a bucket of each simultaneously into the barrel, allowing the two streams to come together. Continue in the same way until the entire amount is made. Stir the mixture in the barrel and transfer it through a strainer into the spray tank. It is then ready for application.

FLY SPRAY.

A subscriber wants to make a good fly spray and asks for ingredients and how to apply it.

A good fly spray can be made from 4½ quarts coal tar dip, 4½ quarts fish oil, 3 yards coal oil, 3 quarts whale oil, and 1½ quarts oil of tar.

Dissolve 3 lbs. laundry soap in water, add the ingredients of the pray, and bring the whole up to 30 gallons with lukewarm soft water. This spray will keep off the flies and prevent the coats of the animals from becoming harsh.

The cows should be sprayed twice a day—in the morning after milking and in the afternoon when in the barn for silage or green feed. With a portable cart, made from a half barrel by attachingwheels and a spray pump and nozzle, two men can spray 40 cows in five minutes.

Thirty gallons of mixture will spray 4 0cows 2 times a day for 10 days at a cost of one cent per cow per day.

There is some danger of overfeeding newly weaned pigs. They seem to have an insatiable appetite, and discretion should be used in satisfying their hunger. The reason for their seeming enormous appetite is not because a larger amount of feed is needed, but because they are accustomed to sucking their mothers many times a day. The secret in keeping young pigs thrifty and growing following weaning is to feed in small amounts several times a day.

500 CHEVIOT SHEEP FOR SALE

Consisting of 300 Breeding Ewes and 200 Lambs.

This flock located on the south shore N. S. has been bred up from native shore ewes and pure bred Cheviot rams until most of them now have only a sixteenth of blood not Cheviot. They pasture in the open, unhoused, upon the abundant feed of the headland ranges and barrens, summer and winter, requiring help in the way of rough hay only and that only on rare occasions when deep snow remains on the ground for any length of time. Among them are many exceptionally fine hardy breeding ewes and from the lambs of this year excellent service rams can be selected. The purchaser by arrangement can have nutil January 1st, 1922, to remove them with free use meanwhile of the ranges, houses and necessary equipment. If purchased for slaughter, beginning with yearlings now ready for market, the whole flock will be in condition upon pasturage alone to market before next January, except a few backward lambs which either will do for feeders to be disposed of during the winter or may be left over to market next year.

For further particulars and inspection inquire of

W. A. KINNEY

THE CITY MILK SUPPLY

Reports From Leading Cities in Eight Provinces

The milk supply of Montreal City was carefully studied several years ago from a bacteriological standpoint by Messrs. Harrison, Savage and Sadler of Macdonald College, Quebec. A report of their findings was published in a Macdonald College bulletin which showed clearly the reasons for under taking the investigation, explained the methods, stated milk standards used, and gave recommendations for the guidance of persons interested in the city milk trade. In The Agricultural Gazette of Canada for February 1915, (Vol. II. No. 2, page 142), a report of this investigation was published.

Since that time an effort has been put forth in other Canadian cities to improve the milk supply, which is of such importance to human life in thickly populated centres. A number of the cities of Canada have made an attempt to improve the herds, farms, milk depots, transportation media and equipment used in the milk business. In many cases the results have been gratifying.

Following up the findings of Dr. F. C. Harrison and his associates The Gazette has endeavored to secure data from other large Canadian cities in the interests of better milk. With this object in view a questionnaire was sent out to the cities of major importance. The questions were intended to be suggestive rather than interrogative, and in some cases the officials treated them as such, supplying full data and valuable information while in other cases yes' or no' were the main replies. However, considerable information of value has come to hand and is treated in the paragraphs following:—

Questionnaire

The circular contained eleven questions as follows:—

1. What are your standards as to
   (a) Butter fat?
   (b) Total solids?
   (c) Bacteria per cubic centimeter?
2. What kind of public control is exercised over milk distribution, from the standpoint of
   (a) Sanitary protection—
   (b) Delivery service—
   (c) Dairy farm inspection—
3. What classes of milk are recognized?
4. What percentage of milk is sold as certified?
5. What are the requirements re pasteurization and at what temperature and exposure is pasteurization done?
6. Have you a municipal laboratory
7. How much milk is consumed daily, per capita?
8. Have you a Sunday delivery?
9. From how large a radius of miles surrounding your city is the milk supply drawn and what is the maximum of time that elapses between the milking and the delivery?
10. What are your requirements re tuberculin test?
    (a) By who is the test conducted?
11. Do milk producers have to obtain a license to sell or ship milk to your city?

IN NOVA SCOTIA

Twenty five cities in different parts of Canada responded with the required information together with copies of by-laws governing the milk trade. From these replies, and from a perusal of the by-laws, it is evident that many cities are putting forth honest efforts to protest the consumer against the carelessness of producer and dealer. In some cases assistance and encouragement are meted out to those engaged in the production and distribution of this commodity.

From Nova Scotia two replies were received indicating that in Truro and Halifax persons engaged in the milk supply business must secure a permit licensing them to carry on. The by-laws in each case point out clearly the responsibility of the milkman and the penalty in case of transgression. The Health Board of the city of Halifax prepared a poster for use in prominent places on the premises of dairymen and dealers. The suggestions contained in this poster are worthy of consideration by all persons engaged in the mlk trade. For this reason they are given in full as follows—

The Barnyard

1. It should be well drained clean and dry and should be as much sheltered as possible from the wind and cold. There should be no pools of stagnant water or urine therein.
2. Manure should not be allowed to collect in the barnyard and should not be at any time in contact with the stable or milk house.

The Stable

1. Cow tables should be well lighted and ventilated. The ventilation should preferably be from the top.
2. There should be at least 400 cubic feet of air space for each cow, otherwise extra ventilation should be provided.
3. Walls and ceilings should be kept clean. The table hould be white washed twice a year, and more often if necessary.
4. It is desirable that the place where the cows are kept be used for no other purpose. A cow barn should not be used as a storage place for straw, hay or other feeds, or as a wagon or tool house, as the dust and dirt which accumulates in a place of ths character is liable to drop into the milk while it is being drawn from the cow.
5. The ceilings should be so constructed that dust and dirt therefrom shall not readily fall to the floor or into the milk. If the space over the cow is used for storage of hay, the celing should be made tight to prevent chaff and dust from falling through.
6. Stable floors should be made tight and smooth and be of some non absorbent material. Dirt or earth floors and gutters cannot be tolerated.
7. The flooring where the cows stand should be short enough so that all manure will be dropped into the gutter and not upon the floor itself.
8. The floor should be swept every day, but not before milking.
9. Cement gutters and mangers are the best, as they can be more easily kept clean than if made of wood.
10. The manure gutter should be from six to eight nches deep and should be kept at all tmes fairly free from manure.
11. Manure should be removed from the stalls and gutters before the morning milking and also before the afternoon milking, where the cows remain in the stable all day.
12. The use of land plaster or lime is recommended in the gutters.
13. Allow no strong smelling material in the stable for any length of time. Store the manure under or outside the cow stable and remove it to a distance as often as practicable.
14. If individual drinking basins are used for the cows they should be frequently drained and cleaned.

The Cows

1. The cows should be kept clean and be free from disease.
2. Have the herd examned at least twice a year by a skilled veterinarian ..ever add an animal to a herd until certain it is free from disease, especially tuberculosis.
3. Promptly remove from the herd any animal suspected of being in bad health, and reject her milk.
4. The cows should be groomed daily, and all collections of manure, mud or other filth hsould not be allowed to remain upon their flanks, udders, sides, or bellies.
5. The clipping of long hairs from the udder and the right side of the cow is of assistance in preventing the collection of filth, which may drop into the milk.
6. The hair on the tails should be cut so that the brush will be well above the ground.
7. The cows may be bedded with sawdust, shavings, leaves, straw or some equally clean material.
8. The use of horse manure for bedding is to be condemned. Sand or loam must never be used for bedding
9. To prevent the cows from lying down and getting dirty between the cleaning and milking, a throat latch or rope or chain should be fastened across the stanchions under the cow's neck.

The Food

1. Feed liberally, and use only fresh, palatable feed stuffs, in no case should strong smelling or decomposed or mouldy material be used.
2. Do not allow any strong flavored food, like garlic, cabbage and turnips to be eaten by milch cows.
3. Provide water for cattle in abundance, easy of access, always pure and fresh.
4. Salt should always be accessible

The Utensils

1. Milk utensils, for farm use should be made of metal and well tinned and have all joints smooothly soldered. Never use them if they become rusty or rough on the inside.
2. Dairy utensils should be cleansed directly after using by first thoroughly rinsing them in water; then clean inside and out with hot water in which a cleanng material is dissolved; then thoroughly rinse with plenty of water; and lastly sterilize by boiling water or steam. Use pure water only.
3. All milk utensils and strainers should be thoroughly cleansed by the use of boiling water, and all cans, utensils and strainers must be sterilized before they are used.
4. Milk strainers should be kept exceedingly clean, and scalded a second time just before using. If cloth strainers are used, several of them should be provided in order that they may be frequently changed during the straining of the milk.
5. After cleaning, utensils should be inverted in pure air. Milk utensils and cans must not be left in the cows stables, by the dusty roadside, near the sink drain outlet, and pig sty, or the open privy vault.
6. Ice tubs and cooling tanks should be thoroughly cleansed by a scrubbing at least once a week.
7. Remember that the milk cans must not be used to carry water for cattle or for other uses on the farm.

The Milk and Milkers

1. No person having any communicable disease, or one caring for persons having such disease, should be allowed to handle the milk or milk utensils or assist in the milking.
2. The hands of the milkers should be carefully washed immediately before milking. The hands should be thoroughly washed with soap and water and carefully dried on a clean towel.

(Continued on page 858)

Notes From the Nova Scotia Agricultural College

THE ARMY WORM SITUATION

During the past two weeks two insects have wrought serious damage to cereal and turnip crops in Nova Scotia, the army worm attacking grain crops, and the aphis or green plant louse attacking turnip and other root crops. As soon as information reached the office of the Department of Agriculture, Truro, field men were sent out. These soon found that the outbreak of army worm was too extensive for their limited forces to cover, so the circulars given below were issued through the Press and by mail, giving directions for fighting both insects.

Word has since been received from many farmers who have tried these remedies with striking success. One man in whose grain field the army worm was so numerous and widespread that he had given up hope of saving it, and was with difficulty persuaded to try, states that he will never again fear the army worm. The trench system was in this case out of the question, so the poisoned bran was scattered over a part of the field In the morning there were thousands of dead worms, in some places numbering thirty or forty to a square foot. This was enough. He drove post haste to the nearest town for a full supply of the materials, and has saved the major part of his field.

This preparaton seems to be preferred by the worms to any other food and where they were plentiful not a speck would be left. The army worm pest may occur at any time, and when it comes there is little time for preparation if the crop is to be saved. It is well worth while, therefore, to cut out and preserve the directions given, as a safe-guard for the future.

HOW TO FIGHT THE ARMY WORM

1. To Protect Uninfested Fields.

Plow a furrow around them, throwing the land away from the field to be protected, dig a series of holes a foot or more deep at intervales in the furrow and scatter in poison bran mash. ,

To protect the remainder of field part which is infested, mow a swath between the infected and uninfected portion and proceed as above. If time permits the plowing of an additional furrow, is an added protection.

2 To Protect Fields Already Infested

Broadcast poison bran mash over the field all through the grain, usng from 50 to 60 lbs. to the acre.

In some cases where the grain is already turning it may be cheapest to harvest the grain immediately, allowing it to ripen in the straw. If still very green, however, it should pay well to apply the poison.

HOW TO MAKE POISON BRAN MASH

Mix thoroughly 5 lbs. Paris Green White Arsenic or Arsenate of Lime, with 100 lbs. of bran or 50 lbs. bran and 50 lbs. fine sawdust, while dry. Then add enough water to make the mixture moist but not sloppy, mixing well.

The addition of 2 gallons of molasses to the water is believed to increase the effectiveness of the mixture.

TREATMENT OF PLANT LICE

Aphids, or plant lice, are this year causing extensive damage to crops, especially to turnips, carrots and parsnips. Only the prompt application of the correct treatment can save much valuable food.

For use against this class of pests Blackleaf 40 is the approved remedy. This powerful nicotine compound is used in the strength of 1 pint to each 100 gallons of water to which should be added 4 lbs. (not cakes but actual pounds) of laundry soap, first shaved fine and dissolved in warm water. The materal is best applied by means of an ordinary orchard sprayer equipped with either one or two leads of hose attached to the regular bamboo rods. A good pressure should be secured and the spray directed against the under sides of the leaves. Unfortunately in the case of the potato aphis which is also very abundant, the leaves are badly curled and it is now useless in most cases to attempt treatment. It should be clearly understood this material kills only by contact and that every insect must be covered in order to get results. Also the higher pressure we can secure the better the results.

Blackleaf 40 is the trade name for nicotine sulphate manufactured by the Kentucky Bye-Products and Chemical Corporation, Louisville, Ky. It is sold in packages varying from a ten pound tin to a small bottle selling for 25 cents and holding enough to make 6 gallons of spray. Nicotine Sulphate is on the free list and therefore can be obtained from the manufacturers without the payment of duty. Considerable quantities are sold by the United Fruit Companies, Kentville, who have on hand a supply of ten pound and two pound tins selling for $13.75 and $4.00 respectively.

The Companies will ship to any address at the foregoing figure provided cash accompanies order. Every farmer should have a quantity of this material on hand all the time, as it is useful against all sucking nsects, and when necessary to use it, there is usually little time to lose, the outbreak being very irregular and sporadic.

A PROGRESSIVE CREAMERY

Your correspondent recently visited the La Have creamery, which is situated in one of the beauty spots of Nova Scotia, on the banks of the La Have river, at Bridgewater. This creamery was opened in 1914. In its first year of operations it had 140 patrons, and did a business of $11,122. In 1919, these figures had grown to 550 patrons and a total business of $126,965.

This year a fifteen ton mechancal cold storage and ice cream freezing plant has been installed, and is now ready for operation. The ice cream section of the business has grown immensely within the past two years.

The La Have Creamery Company is to be congratulated on their management. Mr. J. D. MacKenzie is not merely a capable and energetic creamery man, important as these qualties are, but is also a public spirited citizen, who, by his other activities and interests creates an honoured place in the community for his business enterprise.

One of the main problems of this creamery as of others is that of securing the cream from its patrons in a sweet condition. This difficulty is perhaps more acute in this district than in some others on account of the owners of the smaller herds being more inclined to hold their cream over. A great deal can be done by the individual patron to lessen this difficulty, and thus to make possble the very hghest quality of product.

DAIRY PROGRESS AND PROSPECT

During his itinerary of the creamery districts of Eastern Nova Scotia Dairy Commissioner Ruddick quoted some interesting figures regarding dairy progress and prospects in Canada as a whole.

The greatest expansion has taken place in the four western Provinces. In the period from 1900—1919, the creamery butter production in these Provinces grew from a total of 2,699,802 lbs., to 26,956,711 lbs. The increase in the number of patrons of dairy factories in the period 1915—1918 was greatest in Manitoba. In Nova Scotia patrons in 1915 numbered 2,972, in 1918 the number had arisen to 4,345. Dairy products for the Dominion in 1919 reached the immense total value of $251,526,201. This in addition to the huge indirect return through skim milk, whey, etc., fed to hogs and other stock.

The impression prevails among expert dairymen that market prices for dairy products will be among the last to drop back. A single fact may be mentioned which indicates some of the reasons why. Denmark, a neutral country, suffered a reduction of 22 per cent in the number of her milch cows during the war. Since peace was restored in Western Europe, the number has slowly increased, but the total increase to date is only 2 per cent. It will take a long time to restore normal feed and stock conditions overseas, and a bare overseas market of course, means high prices in Canada.

INFORMATION AND EQUIPMENT

These are two absolute fundamentals in modern farming. The farmer of today must be supplied with materials and implements of which his for bears never dreamed.

An illustration of this necessity came out in a recent chat with the Secretary for Agriculture, who had just returned from a business trip to Inverness County, N.S. Driving along a road, he noticed a turnip field which was apparently suffering from some disease. Going to the field he found it infested with the green plant louse or aphid, which, by the way, has done much damage to root crops ni different parts of the Province.

The owner of the field blamed the drought. More than half his turnip crop was already lost. The Secretary pointed out the real enemy, and told him that the only reliable cure was a spray of Black Leaf 40, a tobacco or nicotine preparation. On enquiry he found that there was none of this within a radius of many miles. By telegraph he made sure that a supply would be forthcoming within two days. It then transpired that the farmer had no spraying outfit except the ordinary watering can wth which he had been applying Paris green to was a sprayng apparatus within his potatoes. It was doubtful if there was a spraying aparatus within twenty miles, and a message was sent to the college at Truro for one to be sent.

Had this farmer known what was wrong and what to use to exterminate his foe, he could easly have saved enough turnips in that one field to more than pay for outfit and materials.

On another farm the Secretary found a man laboriously applying Paris green in an effort to save his turnips. The material and effort were being wasted, because this material is of no use at all in fighting the aphis. Scores of farmers in outlying districts, when they learned what the trouble was had no means of combating it.

All this points to the necessity of even the small farmer having at hand aspraying outfit for emergencies. The Department of Agriculture also would again urge upon farmers their desire to assist n cases of this kind. When a crop is suffering from a disease or from insect attacks, drop a line to the Department, and at the earliest possible moment the latest information on methods and materials for saving that crop will be forwarded.

Improvement in Strawberries in America by Hybridization and Selection

Varieties of strawberries which, under favourable weather conditions continue to bear fruit throughout the summer and autumn after having given a good yield in spring are more and more appreciated by growers. These types which produce continuously have the stolons very slightly developed and an abundant formation of tufts of fertile branches. They are all derived from Pan American, which originally was a mutation from the Bismarck, an old commercial variety of Fragaria Virginiana.

Among the new types the first place is held by Progressive and Superb, which are rapidly propagated by seed and subjected to suitable crosses with European Alpine varieties of Fragaria vesca with the object of adding valuable new characters. Fragaria vesca (both the European and Mexican types) cannot flourish in North America because of the excessively hot summer, and the fruit, although fragrant, is small and not very firm.

In 1914 Prof. W. F. Wight, of the U.S. Bureau of Plant Industry, who had been sent out to Chile as Agricultural Explorer, sent the Bureau seeds of a strawberry of the Alpine type (Fragaria vesca) bought on the market of Santiago. He was unable to discover their exact origin. These seeds were sown in the Experimental Acclimation Gardens at Rockville, Md. and Chico, Cal., and plants were obtained of vigorous growth, high productivity, and a capacity of adapting themselves to the climatic conditions of the United States, superior to that of any other variety of Fragaria hitherto studied. The characteristics of the new strawberry (No. 35,905) obtained are:

(1) Resistance to the hot, dry summers of North America.

(2) Continuous production from June till the first autumn frosts.

(3) The fruit is fine and large, but not very firm, and in this respect, inferior to the fruit of Fragaria Virginiana.

(4) Abundant formation of sterile branches accompanied by an abundant production of stolons. In this respect the new Chilian variety is distinctly superior to the Virginiana types with a continuous production and floral ramification but a low stolon production.

In order to combine the positive characters of the South American variety with those of the Fragaria Virginiana variety, a series of crosses were started in February, 1916, on the Bell Experimental Plot at Glendale, Md., between the South American type and the two varieties Early Jersey Giant and Chesapeake. The hybrids thus obtained the characters of the parents in good proportions:—

(1) Uninterrupted production from July till November

(2) in addition to the very copious formation of fertile branches there is an abundant formation of stolons;

(3) the fruit is fine, large and compact.

Attempts are also being made to fix and propagate a new type which would satisfactorily replace the Pan American variety, which, as has been said, has the disadvantage of too slight a formation of stolons.—Van Fleet, W., in the Journal of Heredity. Vol. X. No. 1, pp. 12—16. Washington January 1919.)

Gleanings of Agricultural Progress in New Brunswick

SCHOOL FAIR FOR EVERY DISTRICT IN THE PROVINCE—SEE THAT YOUR SCHOOL RECEIVES THE BENEFITS.

Assistance Given by Department of Agriculture—Write Director A. C. Gorham, Sussex, for Full Particulars.

A concerted effort on the part of the Division of Agricultural Education and the teachers interested in this work will be made, on the opening of the schools, to make the school fair a more perfect organization than ever before.

Financial assistance will be given each district having a fair. Forty per cent. of the prize money will be supplied by this department, while sixty per cent. will be furnished by the school district.

The educational value of the school fair is becoming more fully recognized as trustees, teachers and ratepayers understand more fully the purpose of the fair and its organization.

In every rural community interest must centre around the one fundamental industry of agriculture. Therefore, we take the opporunity of training the boys and girls of the rising generation through the many activities in connection with the school fair.

The truly cultural comes through the practical, the interpretation of the rules set forth on the prize list, and the selection, for competition, specimens grown in the home or school garden tends to develop the powers of observation and discrimination.

It is intended that the organization of the school fair shall be so directed by the teacher that the greater part of the work and management will be carried on by the pupils themselves. Civics should be taught; every school district should know how to organize and manage a school fair. There should be a manager elected, committees appointed from among the pupils, and the duties of each clearly outlined.

The school fair forms a bond between the home and the school. Parents are usually interested in the boy's or girl's exhibit. They should assist the pupil by encouraging him to make his best selection, exhibit honestly and always with a spirit of fair play.

Judges should be chosen from a nearby district or any fair-minded person in the home district possessing sufficient knowledge of the subject should be able to do the judging satisfactorily. Judges should be decided upon at a conference of the teacher and the managing committee. At this meeting it should be clearly outlined as to how the exhibits are to be scored so that the prizes will be awarded for merit according to standards set in the best agricultural teaching. A representative from this department will assist in this connection.

The spirit of friendly rivalry which plays so large a part in stimulating interest, makes competition keener; every boy and girl looks forward with keen anticipation for the judge's report on the day of the fair. If he has won a prize it will be explained why his exhibit has been given a place higher than that of his competitor. If he has not been so fortunate he will find the cause of his failure, thus adding to his education along certain definite lines so that his chance for success next season is greatly increased. A standard has been set which he will be encouraged to attain.

The school fair is an institution where definite instruction has been given for organization, management and exhibiting of products of the garden and work of different kinds. In the fair the pupil is able to visualize the results of his efforts in his home plot, school garden and poultry project.

Almost without exception the exhibits of the school fair have shown better quality than the exhibits of the larger fairs of the district or county. While not so great in extent they forshadow a higher type of fair for the future and greater efficiency on the part of our rural citizens.

DEVELOPMENT OF THE SHEEP INDUSTRY IN NEW BRUNSWICK.

New Brunswick's policies for encouraging sheep production are receiving considerable secognition and publicity these days in other provinces. These policies developed under the direction of the Hon. J. F. Tweeddale, Minister of Agriculture, have been in operation long enough now to indicate their very great benefit in raising the standard of the stock produced and encouraging farmers to increase their output.

The Farmers Magazine, one of the leading agricultural journals in Canada, and published in Toronto, has this to say in an article published in the last number:

"Sheep raising in New Brunswick has received a distinct stimulus during the past few years. At the present time there are more breeders of pure breds in New Brunswick than in any other Maritime province. While years ago New Brunswick farmers were marketing only about 5,000 lbs. of wool co-operatively, during 1919 they marketed 60,000 lbs. and in 1920 the amount will reach 70,000. and the grader stated that it was one of the best lots of wool that he had ever hnadled. Moreover, the pure bred breeders agreed with Provincial and Dominion Departments to have their pure bred rams inspected and graded. By this procedure the man who is not producing a good class of pure bred stock is given a very low classification and the man who purchases a pure bred ram for the first time is protected from this type of breeder.

The Provincial Department of Agriculture gives a bonus to the men producing rams that would be considered of show quality, or, as it is termed 'three star rams.' For this grade they give a bonus of $3.00 per head. For the next grade or a 'two star ram' a bonus of $2.00 per head is given and for the last grade no bonus. Thus in many cases unsuspecting huyers were saved a good deal of money by being made aware of the quality of the animals. The Provincial and Dominion Departments of Agriculture co-operated in assisting farmers in different sections of the province in marketing their butcher lambs directly on the Montreal market. In this way the net gain was from two to three cents per lb. On a total of 2,600 lambs they made a gain of more than $5,000.00."

The above article does not tell the whole story but is an indication of the recognition being given to New Brunswick's methods. This province was the first to adopt the method of grading pure bred rams. In fact there is no record of it being done in any country in the world. Other provinces are now making plans to follow New Brunswick's lead. The system is undoubtedly good and has a very beneficial influence in improving the quality of rams being offered for sale by pure bred breeders and in the protection of the man buying a pure bred ram for his grade flock.

In still another way New Brunswick sets the pace. No other province has given financial assistance to induce a man who has never used a pure bred ram to purchase one, and determine for himself that it pays to do so. New Brunswick arranged last year to grant a bonus of $5.00 on the purchase price of a pure bred ram to any person never having used one before in his flock, this to supplement a ten dollar bonus given by the Federal Live Stock Branch for the same purpose. By means of this policy approximately one hundred men purchased pure bred rams for the first time. These men owner 1810 ewes and with an average of a lamb and a half per ewe would represent 2705 lambs in the province sired by a pure bred, that would otherwise have been sired by a grade or scrub ram. These figures speak for themselves and need no further commendation. In what better way could encouragement be given in raising the standard of quality of our sheep.

The Department are extending their operations further and have come to a definite agreement with Mr. H. S. Arkell, the Dominion Live Stock Commissioner, in regard to assisting in the further development of the co-operative marketing work. It is realized that this must go hand in hand with production work. In other words a profitable amrket must be found for the stock produced by the farmers and such a market will pay the world's marekt price and take any quantity that may be offered. Farmers will be assisted in organizing for co-operative marketing and everything possible will be done to develop this work in the province. Thus the chain will be made complete and New Brunswick will have a system in operation for the development of the sheep industry that is not equalled in Canada.

Tip Burn of Potatoes

(Experimental Farms Note)

A trouble which is widely distributed and very prevalent in some seasons, and to which the name "Tip Burn" has been given, is to be found among our potato crops. This trouble takes the form of a gradual turning and drying-up of the leaves of the plants, often commencing at a comparatively early stage in their growth and, in many cases, if allowed to go on unchecked, slowly but surely involving the whole of the plants so that they die down a considerable time before the tubers are fully developed.

The appearance of this trouble in the fields is often mistaken by growers for Late Blight. There is however, a marked distinction between the two, for Late Blight may commence by attacking any part of the plants—leaves and stems alike—has a dark, water-soaked appearance and, in its early stages is damp to the touch, while Tip Burn invariably commences at the margin or tips of the leaves and has a decidedly dry appearance and touch with the exception of after rain. It also appears much earlier in the season than Late Blight has ever been recorded, and does not cause the death of the plant so rapidly. Nor has it ever proven so destructive as Late Blight, although evidence has been obtained that in seasons when it is severe and where no effort is made to check it, a considerable reduction in the yield of marketable tubers, due to the premature death of the plants from this cause, may result.

Investigators of this trouble are not yet in agreement as to the cause. The observations of some have led to the belief that a period of hot, dry weather during the growing season causes the leaves to throw off moisture more rapidly than it can be furnished by the plant, the result being the appearance of Tip Burn. This belief seems however, to be disputed by the fact that the trouble it not found in the hot regions of the Western States where the temperature often becomes excessive and the air is especially dry.

More recent investigations lead to the belief that this burning of the leaves probably follows the depredations of the insect known as the Potato Leaf Hopper. These investigations are not yet complete, but enough evidence has been produced to serve as a warning to potato growers to keep these insect pests thoroughly under control in an endeavor to avoid Tip Burn.

We have found in our experimental work with potatoes that Bordeaux Mixture will to a large extent control this trouble. In 1918, when it was extremely prevalent, we had several plots to which, for the purpose of experiment, Bordeau mixture was not applied. These plots suffered from a severe attack of Tip Burn and the plants were all killed down by the second week in August, while other plots on the same land, and to which for the control of Late Blight, Bordeaux mixture was regularly and thoroughly applied, suffered to a very slight extent only, the plants remaining green until frost came. Bordeaux mixture acts as a repellent to the Leaf Hopper, as well as a protection to the plants; many other cases in addition to that referred to have come to our attention bearing evidence that regular and thorough spraying with this mixture will reduce to a minimum the ravages of Tip Burn.—Geo. Partridge, Asst. Plant Pathologist.

INSULATED MILK CANS.

At the Ottawa, Canada, Experimental Farms a test was made some few years ago to compare the relative effectiveness of the ordinary milk can with an insulated can for shipping milk in warm weather. The insulated can had a double jacket with felt insulation at the top and cork insulation at the sides and bottom between the metal jackets. The cover also had special felt insulation. The cans were each of 10-gallon capacity.

The milk was cooled by the use of the cooler and ice aanks and shipped by wagon. The temperatures as recorded at the farm and in the city are given in the following table:

	Temp. at farm—6 a.m.	Temp. at city—8.30 a.m.	
		Ord. can.	Insl. can.
	Degrees.	Degrees.	Degrees.
July 16....	41	50	42
" 17....	44	52	46
" 20....	39	50	42
" 22....	34	43	38
" 24....	36	48	38
" 27....	38	45	38
" 27....	36	45	38
" 29....	38	47	39
Av. 8 days	38-2	47-4	40-1

During the hot weather of the week of thi strial the milk in the insulated can increased in 2½ hours, not quite two degrees in tempperature, while in the ordinary can the increase was over nine degrees. Applying this result to conditions where the milk or cream is not cooled much below 48 degrees and where it must travel several hours without refrigeration, the value of the insulated can is clearly demonstrated.

Sweet clover is proving to be a valuable pasture crop. It appears capable of carrying more stock per acre than the other clovers and grasses.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark
Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written compiaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.
Contract rates on application.
Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME PUBLISHING CO. or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

DATES OF ISSUE.

September	14—28
October	12—26
November	9—23
December	7—21

AUGUST 31, 1920.

THE SEASON OF FAIRS

The time will soon be here again when everyone spends a few days at the county fair. It is a great place, isn't it? Lots of fun and so many things of interest to see. But don't forget the fair will be just about what the people of the county make it and you happen to be among the people of your county. If everyone is interested, then there is bound to be a good fair. I don't mean just interested to go and see what the other fellow has done but just interested enough to do something for ourselves. You want to learn about new things, then you should be willing to give the other fellow advantage of seeing and learning about the things you do. That is one of the best ways to learn.

Now, there is only one way to do this at a fair and that is to exhibit or show the results of some of your best work in the department which will be open for your entries in the shows and fairs this fall. This should be one of the things uppermost in your minds from now on. We don't want to miss it and that is why we are telling you about it now. Surely, every club boy and girl expects to exhibit. But it doesn't make any difference whether you belong to a club or not, you can exhibit something anyway. But think about it and lay your plans carefully for making the best exhibit you have ever made. Even if you have already won first money and blue ribbons, there is a chance for you to improve, for to be sure no once has yet reached his ideal in the samples he has exhibited before.

No farmer need sit back and say, "I wish I had something to exhibit" for there are so many things to show at a fair. Farm products and stock of all kinds are always included among the exhibits and to be sure, there is something on your farm or in your garden which would make an addition to any department of the show. Those who have already exhibited know something about how to put up exhibits. But there are always those who are entering for the first time and it is for these that this article is especially written.

DOES A FARM EDUCATION PAY?

Hundreds of young men will soon be leaving for the farm colleges of the country, and we will again hear the value of a farm education discussed pro and con. The thing overlooked in many of these exchanges of views is the receptivity of the student for education.

Some bodys pass through a college and see only professors, books and examinations. Others see in their places leaders who inspire an ambition to be something and do something, who elevate the thoughts and desires. They see in books the essence of men's experience and the accumulated knowledge of the world, which will guide them in after life. They see in examinations the test of their ability to profit by what they have studied. They see in them a stimulus of thought and expression. There are the differences.

In another way, the difference is shown in the viewpoint of two men looking at a farm or a fine animal. One sees only the broad expanse of dirt and objects familiar to the farm. The other sees a great factory for producing wonderful crops and good live stock, an object to engross one's thought and ambitions. One man sees in the fine animal only a four-legged brute; the other sees in the product the work of generations in molding the animal form and character.

Some concrete facts were brought out recently on the value of an education by the departversity. The test sought to discover if the eduversity. Thetest sought to discover if the education of the operator of the farm had any effect on the profits of that farm.

Nine hundred and twenty-eight of these farmers had received a high school education or less. The average labor income of these men was $502 over and above all expenses, and 5 per cent. on their investment. One hundred of the men whose farms were studied had received a college education along some other line than agriculture, and their labor income was $644. Twenty-seven men had received an agricultural college training. The labor income of these men averaged $1,520.

WHY PURE-BREDS?

Why do men engage in the breeding of pure-bred animals? In the census report taken of the Holstein-Friesian Association of America we find various reasons given for engaging in the breeding of pure-breds. The following are some of them:

"I engaged in the breeding of pure-breds because I could feed and care for them just as economically as grades and their offspring is worth more money."

"More profitable than grades. A good demand for all surplus stock. Also it is interesting to breed and develop pure-bred Holsteins."

"Wanted better cattle."

"I like their looks best and their money making."

"Want to breed the cattle that most buyers want to buy."

"To get the money and for the love of the cattle."

"First, because I consider they are the only cattle for milk production. Second, most of my neighbors are raising Holstein stock and I consider it good policy to work with my community on all lines."

It will be observed that these men selected pure-bred cattle because they consider them more profitable than scrubs or grades. It is pleasing to us, however, to observe that the breeding of pure-breds creates a greater interest in their work. In the conduct of any business, the monetary return must not be lost sight of. It is only the dreamer—the pure idealist—who ignores money returns. Those engaged in business appreciate that it is the dollar that measures their success, although it may not be the best measure of human endeavor or of service rendered.

There are no objections to a man making money providing he renders a service. He is entitled to earn and the man who does not have this desire is not, as a rule, a good citizen. In connection with the desire to make money, it is most wholesome to develop an interest in the work of developing animals or machines which are most efficient. Invariably when there is an interest in work, drudgery is removed. It is highly desirable to make work both profitable and pleasant. If a person is not happy and contented in his work, there is little opportunity for happiness in life.

VALUE OF A SOLDIER SETTLER.

What is the value of a soldier settler on the land?

The Canadian Pacific Railway Publicity Department has made a careful study of the question as it relates to farm settlement in the three Prairie Provinces. It finds that the total railway revenue from agriculture, coal and farmer passengers amounts to $163,516,318, taking the figures from September 1, 1915 to August 31, 1916. As there were at that time 219,105 farmers in the three Prairie Provinces the revenue per farmer was $716.33. This sum capitalized at 5½ per cent. gives a return of $13,569.62, the value of each farmer to the railways.

These figures may be accepted as reliable. The Soldier Settlement Board has made 17,003 individual loans to soldier settlers and about 15,000 of these have actually been established on the land. The value of these settlers to the Canadian railroads, therefore, works out to the sum of $81,414,000.

It is difficult to estimate the full value of this class of citizen to the country. If he is worth $13,569 to the railroads, what must he be worth to the country at large as a producer of foodstuffs, as a contributor to the revenue derived from taxation, as a well balanced and orderly unit of citizenship loyally supporting the country's institutions and contributing to its greatness?

The C. P. R. bulletin from which the above estimates are taken says concerning a settler's value as a farmer:

"That depends altogether on his knowledge of farming coupled with his energy, determination and enterprise, his stick-to-it-iveness, his ability to learn and his perseverance. Health enters largely into this also, for without health and strength no farmer—other than one possessed of immense means and directs the operations of his employees—can expect to succeed."

If the sheep have ticks, dip them; you can't afford to feed ticks, summer or winter.

EGGS, GOOD AND BAD.

(By G. R. Wilson, Dominion Poultry Dept. for N. B.)

The egg is a highly perishable product. It is at its best when freshly laid. Cheese improves with age (generally speaking), eggs deteriorate wtih age.

A Word to Producers

Your eggs will bring more money if you—

1. Produce infertile eggs by removing the roosters from your flock when the breeding season is over.
2. Provide clean nests and keep your eggs clean.
3. Do not wash eggs. Washing the eggs removes the resinous protective coat and permits bacterial infection, causing spot rot and mouldy eggs.
4. Gather your eggs twice daily during the summer to prevent them being heated by the hen.
5. Keep your eggs in a cool, dry place away from the flies.
6. Market them at least twice each week.
7. Insist that they be bought on a quality graded basis.

Why Eggs Should be Candled

1. Candling provides a fixed standard for trading by doing away with guess work.
2. It makes possible a fair price to the careful producer of good eggs.
3. It shows who is responsible for the bad eggs, and who wastes food.
4. It leads to a general improvement in quality.
5. It conforms to law.
6. It saves freight charges, transportation space, and case material, by eliminating the handling of worthless product.

Every egg you ship or sell should be fit for human food and you should be paid according to that food value.

A Word to Egg Dealers

The hen delivers a good egg—do you?

Do you realize that your profits will be greater and your products more uniform if you—

1. Buy eggs on a quality graded basis?
2. Candle carefully?
3. Pack carefully in new cases and new fillers?
4. Keep in a chilled room?
5. Handle eggs carefully to avoid breakage?
6. Ship often to avoid staleness?
7. Load properly to prevent damage?

Eggs which Cannot be sold or Shipped in Interstate Commerce

1. Black rots.
2. Mixed rots, white rots or addled eggs.
3. Blood rings.
4. Stuck yolks.
5. Moldy eggs.
6. Eggs with bloody whites.
7. Eggs with chickens in them.

Or any other egg unfit for food.

Eggs that Should be sold Nearby

1. Large hatch spots.
2. Heavily shrunken eggs.
3. Settled yolks.
4. Cracked eggs.
5. Leaking eggs.

A rotten egg feeds no one.

How to Candle Eggs

It is necessary to rotate an egg before the candle if one is to obtain an accurate knowledge of its condition. By tilting at various angles, the location and size of the air space can be seen, and very often the position of the yolk. The quality of the egg is very largely determined by the case with which the yolk moves and the direction of its motion. The operator therefore—

1. Grasps the pointed end of the egg with the tips of the fingers.
2. Holding the blunt end uppermost, places the egg closely against the opening, or spout, of the candle.
3. Gives the egg a quick turn to the right or left watching the movement of the yolk.

If the egg is perfectly fresh it may be difficult to find the yolk at first glance, but as the egg is turned a glimpse of it will be obtained.

Eggs Before the Candle

A good fresh egg will have a small air space. The yolk should be very distinct. There should be no black spots or rings. Sometimes the eggshell has fine cracks in it. This is commonly known as a 'check egg' and should not be shipped with first quality eggs. It spoils very quickly.

Blood Rings are partially incubated eggs, which show a distinct ring of blood on the yolk. They are unfit for food and should be rejetced.

Cause: A fertile egg in which the development of the germ has proceeded until blood has formed and the embryo has died. Ring formation is not present while the embryo is alive, although blood spots or veins may show.

Mouldy Eggs have black spots that show only before the candle. They are unfit for food.

Cause: Field nests or wet nests, holding eggs in a deep place, or washing them. Dampness allows mold spores to enter the pores of the shell and grow inside. Mold can also enter through cracks in the shell.

Black Rots look more or less black before the candle, and are unfit for food.

Cause: Dead chick, accompanied by bacterial decomposition, or extensive growth of mold and bacteria inside of the shell.

Mixed Rots, white rots or addled eggs when turned before the candle show the yolk more or less mixed with the white. They are unfit for food.

Cause: Bacterial decomposition usually following advanced staleness.

Stuck Yolk eggs have yolks apparently stuck to the shell. They are unfit for food.

Cause: In hot weather, when fertile eggs are kept without turning, the yolk may rise through the white and become attached to the shell membrane. In cool weather the yolk may settle in the shell and become fastened to the shell membrane.

Heated eggs before the candle will show dark, heavy yolks, easily movable and with a distinct reddish glow.

Cause: Egg is fertile and has been exposed to temperature which start chick development. If temperature is high enough and sufficient time elapses, development will continue until the embryo and blood form.

THE CASH VALUE OF A PEDIGREE

(Experimental Farms Note.)

All animals have a pedigree of some sort, whether pure-bred or scrub. Only the pure-bred animals have their pedigree registered and have pedigree certificates issued. A pedigree is valuable only when it proves some fact that is worth while about an animal, either favorably or otherwise. We frequently hear comments of some such nature as "I do not care about the papers, it is the cow I want." Speaking broadly that may be good business for a butcher, but the real stock breeder is paying more attention to pedigree than ever before and we often hear him say "that is a beautiful individual but I do not like her breeding."

The man who attaches the most value to a pedigree is the one who knows the most about its true value. The pedigree student may learn of a cow that has had a brilliant showring career. She may be particularly pleasing to the eye in type form and conformation. He studied her pedigree and finds that she has sprung from ancestors that were of little value and immediately decides to let her alone, regarding her as a freak. On the other hand he may find a cow that is not a particularly fine individual in type but he studies her pedigree and finds that she has for ancestors some of the very best animals of the breed. He decides to buy the cow, doing so on what he knows about her ancestors. He has made use of the pedigree to select a cow that he has not, as so many are inclined to state, paid a big figure for papers.

Pedigree does not make value, it decides value by establishing the history of ancestry. The cow backed by several generations of good producers is much more liable to be the dam of producers than the cow whose dam only, of all ancestors is a producer. This does not of course, always hold true. Just as we frequently find a good individual with a poor line of ancestors, so do we find poor individuals with strong ancestors. Like, as a general rule, produces like, but the law of variation is also felt. The pedigree student studies these laws and draws his conclusions.

When a cow is purchased for a breeding herd two things are kept in mind, first the value of the cow for what milk she will produce and secondly, the effect she will have upon the future of the herd. A good judge of dairy cattle can estimate closely her value as a milk producer but her worth as a herd improver must be determined chiefly by pedigree.

Individual merit is very important and should not be overlooked, yet it must not be the main deciding point. History shows us some excellent individuals who have apparently sprung from inferior stock and later have become wonderful foundation cows. Such animals are valuable if properly developed, but the owner must have skill and patience to handle a problem of this kind as often, after a few generations, there may be a reversion back to the old ancestral type.

Some herds have been built almost to perfection with the exception that possibly a single defect may be noticed through the entire herd. The owner is a true stock breeder and wishes to have as perfect a herd as possible. He decides to secure a new sire and correct this fault. He selects an animal not only strong itself where the defect is shown in the herd, but the breeder finds that the animal is from families perfect in this respect. This sire is more certain to correct the fault than an animal who is strong individually but part, or all, of his ancestors are weak.

This is where the real value of a pedigree is recognized. It is not so important to know simply that an animal is pure-bred as it is to know that the strain in the herd is of the very best.—W. M. Hicks, Supt., Agassiz, B. C.

SIXTY- FOUR CENT EGGS

We will pay sixty-four cents per dozen for strictly fresh eggs, delivered at St. John. This offer will hold good for two weeks. All shipments must be prepaid and addressed THE MARITIME FARMER, ST. JOHN, N. B. Ship in case lots. All eggs are subject to candle test. We will be glad to get fresh eggs right along and will offer the highest market price for them. Get your neighbor to make up a case with you. If one neighbor can't do it, ask others to help out. This price is well over the price being paid for eggs by any dealer in New Brunswick.

THE EFFECT OF CERTAIN ORGANIC SUBSTANCES ON SEED GERMINATION

Previous experiments have shown that green manure is unfavorable to the germination of certain seeds, the injurious factor being attributable to certain soil fungi. A continuation of these investigations gave further data on the effect of different organic compounds on germination. The results obtained showed that alfalfa powder, casein, and petpone, have little or no effect on the germination of different types of seeds except when used in large quantities. There is, however, no relation between the injurious effect of green manures and their nitrogen content. The reduced germination due to the application of excessive quantities of casein or alfalfa powder is not further reduced by applying celcium carbonate.

Sugar delays germination and, at the same time, favours bacterial development and also reduces the germination percentage. The retarding action of sugar on the germination of seeds is due to the large amount of carbon dioxide formed during the decomposition of the sugar.

Sterilization of the soil inhibits the germination of seeds to a considerable extent.—Fred, E. B., in Soil Science, Vol. VI, No. 5. pp. 333—342. Bibliography of 27 publications. Baltimore. November 1918.

While cleaning up tuberculosis in pure-bred herds some scheme should be inaugurated to lessen the disease in commercial herds. The industry is suffering heavy loss each year as a result of tuberculosis having made inroads into the herds.

LIVE STOCK.

FEEDS THAT MAKE STRONG BONED HOGS.

If you want strong-boned hogs, hogs that will carry their flesh well, give them the feeds to make bone. A good bone development is a great asset to growing hogs; the lack of it is seen in the big stock yards where hogs with a light or weak bone are crushed or mashed, legs broken or ribs caved in through shipping and handling.

Mineral matter in the feed, or available, will produce good bone growth if of the proper kind. Most of the mineral feed eaten by hogs is utilized in the bony structure or skeleton. The grain we commonly feed hogs contains such a small proportion of the needed mineral elements that additional mineral feed must be supplied by some means in order to properly nourish the bones.

Oftentimes conditions are such that the hog picks up the minerals itself. Hogs having access to lots where ashes and limestone are dumped may supply themselves in liberal quantity of the calciums. Hogs running in the woods or woodlot or on pastures of most kinds commonly grown, supply their bodies with mineral nutrients.

You will never find weakened hogs where they have access to pastures. But if hogs are confined it is very essential that their bodies be supplied with mineral feeds; especially is this true of hogs kept for breeding purposes.

Wood ashes and cinders are eaten by hogs to satisfy a craving for mineral food. I have seen them crunch the fresh cinders as if they were corn. Charcoals are beneficial to the digestive tract. Besides these, bone flour is valuable to furish phosphorus and lime, also. Growing pigs require salt in their ration; t is an aid to digestion.

A good mixture which can be fed to pigs confined in small lots or that may be given to pigs on range, is made up of the following ingredients: One hundred pounds of wood ashes, 30 pounds of salt, 40 pounds of slaked lime, four pounds of copperas, 30 pounds of charcoal; mix well and feed three or four times a week. THE SHEEP BOT-FLY AND IT'S GRUBS.

There seems to be a good deal of misinformation regarding the sheep-bot-fly and the larvae or grubs from it which torture sheep. The maggot problem also is perplexing and we shall therefore give some proven facts on these matters which should be of interest and instruction.

Description of Bot-Fly.

A sheepman with whom we talked on this subject the other day said that he was unable to identify the exact fly that laid the eggs from which grubs develop in the nostrils. Asked what he thought the fly looked like, he said he thought it might be about like a honey-bee and of similar size. Taat seems to be the idea of several men with whom we have talked, but it is erroneous.

The sheep bot or gad-fly appears from June to October and is seen on bright, warm days, on pastures where sheep are grazing. The female is so small in size and flies so fast that it is difficult to observe it. It is a trifle larger than an ordinary house-fly, yellowish grey in color, covered with short fine hair and has five rings on its abdomen. It is known technically as the estrus ovis and is of world-wide distribution.

The Fly Deposits Larvae.

Most people believe that the fly lays eggs in the nostrils of the sheep and that larvae or grubs then hatch out and find their way up the nostrils. This is not the fact. The femals fly deposits hatched live farvae in the entrance or vestibule (anterior nares) of the nostrils. At this time the little larvae is creamy-white in color and about one-sixteenth of an inch in length. Later, according to Prof. Underhill, it becomes darker, and at maturity reaches a length of about three-quarters of an inch. Upon the head segment or porton of the body of the larvae there are two hooklets, the ponts of whch are curved downward and backward. Aided by these hooks the larvae at once climbs upward through the nasal passages until it reaches the frontal sinuses, where it attaches by its hooklets to the lining membrane. Then it feeds upon the mucus and serus fluid which flows from the membrane terribly irritated by the wriggling of the larvae and the prickling of the stiff spines of its rear segments, together with that from the two hooklets. The larvae remain in the sinuses or upper passages of the head about ten months, at the end of which time, having reached their larval maturity, they detach from the mucus membranes and pass to the nasal passages from which they are expelled by violent sneezing excited by their presence. Some of the farvae fail thus to escape from the sinuses and possibly become mummified, or are practically digested or absorbed. When the larvae reach the ground they quickly bury themselves, contract within their smooth, dark shells and enter upon the pupal stage of existence. In from four to six weeks they finish the pupal stage of life and emerge from the ground as flies to carry on the pestiferous work of their kind.

Signs of Fly Attack.

When sheep hear the buzzing or humming of the bot-fly they run, stick their noses into the sides of other sheep or into the ground, or try to raise a thick cloud of dust to keep the flies away. They are also seen to paw their noses with their feet to rid them of the flies; but all of their efforts usually fail and some larvae are sure to find their way into the nostrils. Goats are similarly attacked and act as do sheep.

Symptoms of Grubs in the Head.

After larvae begin to work upward in the nostrils, a discharge starts running from the nose and the sheep sneezes, coughs and tosses its head. These symptoms, slight at first, gradually become worse and the discharge turns to a muco-purulent flouid, or pul-like discharge, aften tinged with blood. When such a discharge is seen, many grubs are present. One or two grubs may cause comparatively little disturbance or distress. In very severe cases so much discharge forms that it tends to obstruct the air passages and the sheep has great difficulty in breathing, tosses its head backward, pants, sneezes and shows

all of the signs of threatened suffocation. It may then become emanciated and so weak that it goes down, ceases to eat and finally dies. Such cases comparatively are few in number.

Preventive Treatment.

If the flies could be prevented from depositing their embryo larvae in the nostrils there would, of course, be no trouble of the kind we have described; but there is the rub! Treatment rarely proves perfectly satisfactory. The old-fashioned plan of daubing the noses of sheep with pine tar to keep the flies away still is most popular and it cannot be condemned as altogether useless. Persisted in, there can be no question that it is fairly effective. The tar is applied by means of a brush or flat stick, or more commonly sheep are made to smear their noses with the tar by taking salt from holes bored in a squared log by means of an auger and kept well daubed with tar. Another plan is to spray the sheep with a commercial fly-repellant and to smear more of such fly-chaser where it will get on the noses of sheep as they take salt or feed.

Treatment of Affected Sheep.

This is not very satisfactory. Some shepherds state that they have had fairly good results by laying the sheep down, turning up its nose and pouring a teaspoonful of benzine into each nostril in turn, holding one nostril shut for a few seconds after the injection and then treating the other in the same way. Kerosene and oil has been used in the same way; also gasoline. Another plan is to blow snuff into the nostrils to induce sneezing, or a feather dipped in turpentine is inserted in the nostril, worked well upward and then twisted and then withdrawn with the object of bringing out some of the grubs, an effect sometimes attained. In valuable sheep trephining the skull may occasionally pay. This consists in cutting away a disc of bone from th skull, by means of a tubular saw, or trephine, to expose the frontal sinus. Then the grubs that can be seen or got at may be removed with forceps. We once dehorned an adult sheep and the grubs then were exposed and could be removed. The horns grow from the frontal bones, hence it can be understood that the frontal sinuses may be exposed by dehorning. We should not, however, advise that as a feasile treatment to be applied to all horned sheep. We merely mention the experience as one of considerable interest.

That Maggot Problem.

It is the Screw Worm Fly that causes so much trouble among farm animals in the southwestern states. It is technically known as compsomyia macellaria and is blueish green, with metallic reflections, three-eighths to half an inch in length and having three longitudinal black stripes upon its thorax. The head is reddish or yellowish brown and the body is covered with stiff, black hairs. The fly deposits masses of three to four hundred white cylindrical eggs upon wounds, sores, decaying flesh, or within the nostrils or other natural openings of the body. Hatching of the eggs may occur in from one to twelve hours. The larvae are white, slender and active. The head and segments are provided with spines which aid the larvae to borrow into the flesh. The mature larvae is half an inch or more in length and on leaving the flesh burrows into the ground and remains there, in the pupal state, for six to twelve days. The fly starts attacks in June and in July. August and September does its worst work. The larvae grow fast, feed on the flesh and may expose bare bones. Man may be fatally attacked. The maggots may be destroyed by thorough cleansing of wounds and injections of a five per cent. solution of carbolic acid or coal tar dip; or chloroform diluted to a strength of about twenty per cent. is recommended. A one to three per cent. solution of carbolic acid or coal tar dip will keep the flies away, when applied to wounds. Pine tar also is useful. A machinist's oil can is suitable for applying the destroying solutions. Pine tar is best used on oakum as a packing after the maggots have been destroyed. More tar and oakum, or cotton may then be placed on top as a covering.

The Flesh Fly (sarcophaga sarracenia) also is a troublesome house-fly, light grey in color, with reddish brown eyes and shiny body. The female deposits larvae upon fresh meat, or in wounds of living animals. The larval stage, according to Underhill, is completed in about six days and the pupal stage in from twelve to fourteen days. They do most harm to meat for human use. This should be kept screened away from flies. Wounds may be protected as against screw worm flies.

The Blow-fly or Bluebottle-fly causes most of the maggots in the eastern, northern and middle states. It is known as musco vomitoria or calliphora vomitoria, and is familiar to most people who recognize it as much larger than the house-fly, with brownish eyes and bluish green thorax and body. Its eggs are oval, white in color, and are deposteid upon decomposing animal and vegetable matter and in wounds of animals. Hatching occurs in a few hours to one or two days; most quickly in hot weather. In three to nine days the larvae (maggots) mature, drop to the ground, burrow, and in three weeks, or less in some instances, emerge as flies. It deposits eggs; not larvae as does the flesh fly and bot-fly. Treatment for these maggots is the same as for those of the crew worm fly and flesh fly. Preventive treatment is of great importance. All lambs should be docked and the rear kept free from faces-soiled wool during summer. All wounds should have protective treatment. This includes wounds made at shearing time. A little pine tar applied to them usually proves protective. A mixture of lard and sulphur also is useful. So is kerosene or turpentine in oil. The latter mixtures injected into maggot-infested wounds also prove effectual.—Dr. A. S. Alexander in American Sheep Breeder.

DAIRYING.

PRODUCING CLEAN MILK ON EVERY DAIRY FARM

At every convention or assemblage of dairymen the audience patiently listens to one or perhaps many addresses in which the speakers put forth strong pleas for better care of the milk before it leaves the farm. The assembled farmers are told that milk may be either made the most nutritious of foods, or an extremely dangerous medium for carrying disease just according to the care and cleanliness practised in handling it from the time it is drawn from the cow's udder until the time it reaches the consumer's doorstep. The precautions which should be taken on the farm are outlined in detail, and the producer in the audience is told just exactly what he should do or should not do, if he is to work "according to Hoyle."

What kind of an impression do addresses of this type make on the average man in the audience? Well he probably listens—with some slight show of attention—to the whole address, then likely as not, promptly dismisses the subject from his mind entirely. If at a slightly later date a neighbor chances to ask him what he thought of that "lecture on milk," his reply would probably run something in this vein, "Well, if we farmers had as much time to attend to fussy little details as our many Government experts have to talk about them, these fine schemes might work in o.k., but when a man has a herd of ten or a dozen cows to look after, with little or no dependable help, it's a different matter altogether. He has got to cut the corners and get over the ground as quickly as he knows how."

Who is right, the farmer or the dairy expert? Certainly careful precautions in the dairy stable go a long way towards insuring good quality, but it is equally sure that labor shortage on 50 per cent. of the dairy farms prohibits some of the elaborate precautions that are so often preached from platform and press. But surely somewhere between these two extremes lies a golden medium of farm dairy practice which will provide a good, wholesome quality of milk, whether for cheese or city trade, without harrasing the producer to such a long round of routine dairy chores that he is within an ace of throwing the whole business to the four winds, and taking up some other line of work.

The Cowman's Golden Rules at Milking

There are, however, a few simple precautions, which, if put into effect in the dairy stable, would consume no great amount of time and yet might make difference between a bonus check and rather "hot" complaints about the quality of the milk, from the cheese factory or the city distributor.

To begin at the beginning the first chance for contamination is from dirt from the body of the cow falling into the milker's pail. Loose hair, dried mud picked up from a mud-hole in the pasture, bits of straw and the like are examples of the sort of filth that may come from this particular source. It is hardly necessary to outline precautions—about 30 seconds spent brushing the udder and adjacent parts of the body of each cow will serve to remove all such loose dirt.

Cleanliness on the part of the milker himself is another item worthy of attention. If we may be pardoned for saying so, milking "regalia" in many instances finds its way to the washtub not half often enough, purely through carelessness—a circumstance which does not help matters. Some, in fact many, milkers, persist in keeping the hands moistened with milk during the process, thus affording another convenient means of introducing foreign matter.

Milking utensils and the condition in which they are kept are other big items effecting milk quality. Partially covered milk pails are the choice in the very best dairies on the principle the smaller the aperature, the less the dirt that will fall into the pail during milking. After use all milking utensils should receive a thorough cleaning. They should be cleaned with a brush and the use of warm water and some sort of cleansing powder. After this they should be scalded with boiling water and placed out where they will dry quickly.

Rapid Cooling Essential.

Mistakes with serious consequences are often made in chilling milk. Keeping milk clean keeps most of the bacteria out, cooling it prevents the growth of those that do get it. Effective cooling means bringing the temperature of the milk not later than an hour after milking—and preferably sooner—to a temperature of 50 degrees F., or lower. In other words to the temperature of deep well water in the summer. The huge difference which rapid and effective cooling makes in the keeping qualities of milk has been proven time and again by experiment. In one experiment two eight gallon cans of milk were used. One of these was promptly cooled to and kept at a temperature of 75 degrees Fahrenheit, and the other at 50 degrees. The contents of the can kept at the higher temperature soured in 28 hours, whereas the milk in the low temperature can remained sweet for three days.

None of the above mentioned precautions require any lavish outlay either of money or time, and with slight modifications and arrangements to suit individual cases, could be and should be adopted on every dairy farm worthy of the name.

PURE MILK WITH A MILKING MACHINE.

In the production of pure milk with a milking machine, great care is necessary in the handling and mashing of the machine. Milk that is allowed to become dry on the parts is very difficult to get off. To avoid this,

How the Udder of a valuable cow was
saved

Chas. K. Robbins, of Cheboyne Point, Yarmouth, N.S., writes:—

"A recent experience in reclaiming what was supposed to be a lost section of a valuable cow's udder has demonstrated again the great worth of Minard's Liniment. I can recommend it in the highest terms to all who have a herd of cows.

"For years I have never considered my household stock complete without a bottle of Minard's. For burns, bruises, sprains, frostbites, or chilblains it excels. And I know of no better remedy for a severe cold.

"I think I am safe in saying that among all the patent medicines there is none that covers as large a field of usefulness as does Minard's Liniment. A real truism—Good for Man and Beast."

as soon as the last cows are milked and the milk emptied, but while the pump is still running, cold water should be drawn through the teat cups into the can. The machines should then be removed to the dairy and dismantled. The can covers to which the pulsator is usually attached should be washed, wiped dry and hung up. The teat cups and tubes should be washed in hot water, to which has been added some alkaline washing powder. This will dissolve any fats adhering to the parts. Once a day, a brush should be used on the interior of the teat cups. These parts should now be put into a sterilizing solution until next milking time. Once a week, the teat cups and attached rubbers should be taken apart and thoroughly washed in hot alkaline water with the special brushes supplied for this purpose. The cans may be handled with the rest of the dairy utensils in the ordinary way, steaming or scalding and draining in a room from from dust being important.

On taking the tea cups from the sterilizing solution for the next milking, they should be rinsed in fresh, cold water, and then be assembled. At this stage, the drawing of scalding water through the teat cups into the cans would have a beneficial effect, but it liable to injure the rubber. When adjusting ahe milker and attaching the tea cups to the cow's teats, be careful not to draw barn air through the tubes into the can. In shifting the machine from one cow to another and changing the cans let the milk and cans be exposed to the barn air as little as possible.

One of the best sterilizing solutions to use is composed of chloride of lime. Use fresh chloride of lime, preferably from sealed tins, and provide an earthenware crock. Into this put one pound of chloride of lime and add a gallon of cold water. Break up the lumps, stir thoroughly and then allow to settle. Cover and keep in a cool place. This is a stock solution, and only the clear liquid off the top is to be used. In making up the solution for the teat cups use one pint of this stock solution to every ten gallons of water. As the sterilizing action gradually decreases, add another half-pint of the stock solution every three or four days as long as this solution is kept in use. The old solution should be emptied out and a new solution made as often as is necessary to keep it clean. A new stock solution should be made at least every two weeks.

IN SALTING BUTTER USE WEIGH SCALES

Much of the butter made on the farm is not salted properly. The chief cause of uneven salting, that is sometimes high and sometimes low, is not weighing the salt and butter but guessing at the weights. While it may be pardonable to estimate the weight of butter in a churning which some are able to do with surprising accuracy, it is never advisable to "guess" at the weight of salt required for a certain amount of butter. On each and every farm where butter is made there should be a scale that will weigh to ounces or finer. Suppose there are 12 pounds of butter in the churn or on the worker weighed or estimated, then salt should be added at the rate of one-half to one ounce per pound of butter, according to taste or market requirement. If mild salting is desired, 6 ounces of salt will be enough to add to 12 pounds of butter. If, however, a quite pronounced salt flavor is liked, then add 12 ounces or three-fourths of a pound of salt. If a uniform rate of salting were followed there would not be the variations in satl flavor so common in farm-made butter.

It is very important that the salt be evenly distributed throughout the butter. Salt tends to deepen the natural color of butter, therefore where salt is unevenly distributed throughout the mass of butter some parts are more yellow than others, causing a streakiness which is quite objectionable. Persons who do the salting in the churn in order to avoid bringing the butter in contact with warm air on a worker in the room are more likely to have mottled or streaked butter than those who salt on a worker although salting in the churn has several advantages.

DAIRY SUBSTITUTES.

Glass may be made to look like diamonds, but real diamonds are never made of glass. Oleomargarine may be be made to look like butter, but at best it is only an imitation. Oleomargarine has food value, yet it is not butter and should neither be made to look like butter nor sold as such. Butterine is only an imitation of real butter. Nut margarine or nut butter, is not butter. Filled cheese is false cheese. Pure dairy products have a food value particularly and peculiarly their own. For the growing child, the imitation cannot in any sense be made to take the place of the real article. In fact, for any class of human beings there is not and cannot be a satisfactory substitute for any dairy product. —John Bailie.

FACTORS AFFECTING COST OF MILK PRODUCTION

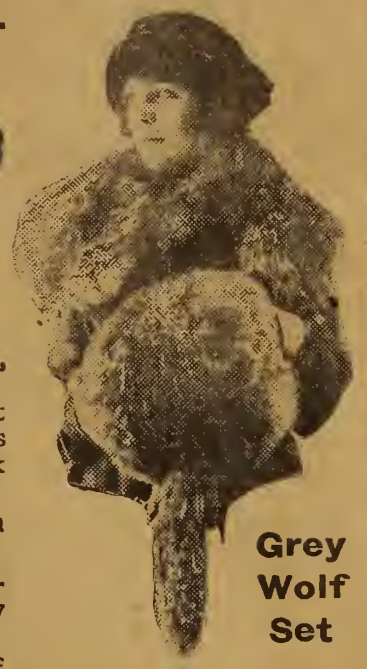
We are all alike interested in the question of cost of milk production, whether producers or consumers. A study of this subject in the State of Delaware led to the following conclusions:

1. "Up to an average of 168 hours of labor per cow, per year, a state of increasing returns was found to exist." How many Canadian farmers give 168 hours of labor to each cow in a year? Not many, we venture to say; yet it is probable that more labor would be profitably spent on good cows.

2. "The dairy farms using the most labor pay the highest price for it." It pays to hire good and efficient labor on a dairy farm. Much of the labor that is sent out from labor bureaus is not at all satisfactory on dairy farms. A farmer might far better be without this food-consuming, inefficient human machine.

3. There was "a general, but irregular tendency for the cost per quart of milk to rise somewhat, as the amount of concentrates used is increased." A man who buys and feeds much concentrates at the present high prices will need to have good cows and receive high prices for his milk, else he will find himself "coming out at the small end of the horn." The investigator observes further on this point: "The greater the incentive to saving and economy in expenditures, the smaller the proportion of concentrates purchased."

You Take No Risk
when you order
Hallam's
Guaranteed
Furs
"From Trapper to Wearer"



Grey Wolf Set
Delivered to You $19.95

If for any reason you are not satisfied you simply return the furs at our expense, and we send back your money in full.

That is our guarantee. Can anything be fairer?

We couldn't afford to do business on this basis unless we know our furs are right.

We know that 99 people out of every 100 are delighted with their "Hallam Furs."

It is also much cheaper to buy your furs by this method. Hallam's furs come direct from the trapper, and go direct to you, thus *you save* the middlemen's profits and expenses.

Simply write out your order for the fur coat or set you have selected from Hallam's Book of Fur Fashions and send it to us with the money.

THE HORSE

WHEN SHOULD HORSES BE WATERED?

Before or After Feeding?

Does it really matter whether a horse is watered before or after feeding? This is a question that is often asked, and, in answer to the queries, the following article will again discuss more fully the subject of watering horses.

There are horsemen who say that it does not make any difference to the health and fitness of a work horse whether he is watered before or after feeding. Also there are careful and successful men who hold somewhat diverse opinions. But all careful men generally make a study of the condition of the animal previous to allowing it to drink, and they also feed and water their horses regularly and pay particular attention to small details. For instance, how many teamsters today on the farm know that it is not so much the amount of water, nor its temperature, as the amount of vigor which the horse possesses when he is watered that governs the result. There are days that a teamster himself is not so inclined to work as others. On these days he has less resisting power, and is not at his best. He can give no very good reason for the cause, but he feels the weakness all the same. In a similar manner the horse has his days that he is not at his best, and the careless teamster fails to discover this. The horse unmistakably shows weariness, and it is accounted to him as laziness. When he arrives at the stable after a heavy day's work, in which he has been feeling "blue," he is just in the right condition to be injured by even a single pail of water.

Watering Determined by Circumstances

There is no hard and fast rule for watering horses that are under the severe strain of heavy work. Either watering before or after feeding may be equally good for them, and the method employed will be determined by circumstances. When a horse suffers a severe loss of water, such as occurs in consequence of long continued exertion at heavy work, the animal may be allowed to drink before he is fed, otherwise he will not feed well. At other times if he is allowed to drink to excess before feeding, the horse will not consume so much as he otherwise would. A horse that is trained to the habit of drinking too much, eats less in the day time than is sufficient to keep up his energy, and if given a full manger of hay at night he will eat too much, as by that time his appetite has returned. This method of watering and feeding results in giving horses large and unsightly abdomens, difficult breathiny and general sluggishness. No amount of good breeding will avail to make horses efficient when through ignorance or carelessness they are fed in the manner described.

Watering Before and After Feed.

On the other hand, if a horse is fed his grain first and then watered, much of the food is carried by the water into the intestines. When fed his grain first and then given a drink of cold water, the heat of the stomach is lowered, and the gastric juice, which is thrown out from the walls of the stomach to digest this food, is washed down into the bowels, along with all the finely masticated food that was ready for absorption. There is ferments, forms gas and often causes colic. No digestion can take place in a cold stomach. Nature has to throw out another quantity of gastric juice to digest this food, which is a great and uncalled for drain on the animal.

When a horse is watered before feeding the water passes out of the stomach and back into the cecum, the first of the large intestines, where it is heated and taken up into the circulation as required. The food is moistened by the saliva, and passes into the stomach, where each mouthful is wet with the gastric juice, and must stay there until part of the diegstion done in the stomach is finished. The food then passes into the bowels slowly, and receives the discharge from the liver and pancreas, which completes the process of digestion.

Three Points to Consider When Watering.

Whatever careless teamsters may say on the question of watering horses there are certain recognized facts connected with it that are of great importance in keeping the horse up to full vigor. A careless feeder never takes any note of the vigor of his team and works his farm just as much as his horses are able and therefore his opinion does not count. To the inexperienced in watching and studying the effect of watering horses at particular times, attention to the following three points will serve as a guide. They are especially important at this season, and in very warm weather when horses are hard at work. In the first place greater comfort and satisfaction can be given a horse by watering him at frequent intervals, even though the amount given at each time be small. Give horses a drink as often as possible in warm weather. If a teamster requires to carry a drink of water for himself to the field, it is equally more necessary to provide a mid-forenoon or afternoon drink for the team. In the second place remember that just as a person cannot work comfortably on a very full stomach, so it is with a horse. If a horse is given water in such periods that a very heavy drink is taken just before going to the field, that horse is uncomfortable at work. This is another good reason why his thirst should be well satisfied before meals rather than afterwards. Thirdly, if a horse is taught to eat a few mouthfuls of hay before oats, there is less danger of the oats being washed through the stomach without being digested. The hay serves as a net work in the stomach, holding the oats but allowing the water to pass through.

The order of watering first, then hay before oats are given, has its drawbacks, unless the horses are trained to this regulation. The accustomed method is to give them their oats first as soon as they enter the stall. The

W. F. YOUNG! Inc., 124 Lymans Bldg., Montreal, Can.

Absorbine and Absorbine Jr. are made in Canada.

HORSE SENSE in horse feeding.

It is shrewd common sense to feed a horse a *balanced* feed, which will develop every part of its body. Analysis of *Purina O-Molene Feed* shows that it contains in proper proportion *all* the elements for muscle, blood, hair and hide making, as well as a large percentage of Nitrogen free extract, which supplies heat and energy. There is no 15 to 18 per-cent waste as in feeding the whole oats, due to swallowing whole.

Purina O-Molene Feed is highly digestible.

horse is generally unsatisfied, anxious and gets into a very nervous state till fed his grain. He generally will not eat at all till he gets it. To overcome this acquired habit of the horse the grain should be mixed with a few handfuls of chopped or cut hay. This will satisfy the desires of the horse by supplying the most palatable part of his food early, and yet insure the retention of the rgain in the stomach for a considerable time.

Preparing the Horse for his Drink.

It is the noon hour meal time that requires more special attention than at other periods of the day. It provides a short time for the horse to feed, and though it is not necessary for him to eat so much at this meal he must have full time to slake his thirst. Most teamsters give horses all the water they wish for when coming from the field at noon, and unless horses are very warm their thirst should be fully quenched at this watering. They will relish the noon meal and drink less when leaving for the field after dinner. There is no necessity for ever having horses too warm for a full drink when coming from the field. The teamster should temper the animals for the coming cool draught of water, by allowing them to cool down before they are unhitched. The speed of the animals should be slackened a few rounds before that time and a good breathing spell given them, thus preparing them for the full drink they stand so much in need of preparatory to the meal. A teamster who knows anything at all about his business, should treat the horse as if human. In the hitching up go slow at the start when the stomach is full, speed up as the hours of labor advance, and slow down before unhitching. Then, and only then, can a teamster truly earn the distinctive quality of being termed a good horseman.

DIAGNOSING COLIC

Every horse-owner knows that his horse is suffering from colic or "belly ache" when the animal rolls, kicks and shows every symptom of pain; but experience and good judgment are necessary to determine just what form of colic is present. Unless a correct diagnosis is made treatment may fail or do more harm than good. It should be the invariable rule not to give medicine to a colic-attacked horse without first studying the symtoms carefully and deliberately, in order that a correct diagnosis may be made. Wrong treatment given on the spur of the moment cannot be recalled or undone. An aloes physic ball, for example, is quickly administered, requires 24 hours or longer to take effect, and tends to irritate the digestive organs. It may help in some cases, but in others will be almost certain to cause death. This is equally true of some other drugs commonly used by untrained persons. The following hints on symptoms will enable readers correctly to diagnose some of the forms of colic. Spasmodic or 'cramp' colic causes severe pains which come and go. During spasms of pain the horse fearlessly rolls and kicks; then the pain subsides, the horse gets up, goes to eating perhaps but suddenly another attack comes on and the same symptoms occur. The pulse is full and fast, but fever is absent. Enteritis or inflammation of the bowels, on the contrary, causes severe constant pain. The horse will start to lie down, but is afraid to do so, and soon begins walking in a circle, a symptom sometimes called the 'dead march,' for it surely indicates approaching death. The pulse is quick and weak, almost imperceptible in some cases, the membranes of the eyelids and nostrils are reddened and fever is present. Urine and feces usually are suppressed, as may be the case in spasmodic colic. Flatulent or 'wind' colic causes drum-like distention with gas high up in the right flank. (Cows bloat in the left flank). The pulse is fairly well, but soon becomes weak and soft. Breathing is impaired. The pain is less severe than in spasmodic colic, but the horse sweats, paws, goes down carefully and lies on its side for some time. Some feces may be passed, or scouring may occur when flatulent colic occurs as a complication of heat exhaustion. Bloat of the stomach, or gastritis (acute indigestion) causes pains like those of flatulent colic and fluid surges back and forth between stomach and throat. This may be accompanied by squealing and spasms of the neck. Rupture of the stomach often fatally ends the attacks. Impaction of the bowels is indicated by pains like those of enteritis, but the horse rolls and lies upon its back. Pawing and straining are persistent when the horse is up. An occasional ball of feces may be passed. When stoppage is due to gut-tie, telescoping of an intestine, strangulation or hernia, or blocking by a large calculus, the horse shows all the symptoms of impaction in acute form and may also sit upon its haunches. Colic drenches may be bought from a veterinarian and kept on hand for spasmodic colic. Flatulence colic often necessitates tapping, by a veterinarian. The expert also should treat all cases of enteritis and impaction.

STAGGERS

J. E. R.—"What can I do for a two-year old horse which walks as if he has the staggers? He ran in stubble and alfalfa until last Christmas. When taken off pasture he was thin but seemed all right. He was given feed of alfalfa that night. The next morning he was down, and we had to lift him up for some time. He had distemper last summer and did not fatten but is in good condition now. He swings his hind legs and his head as he walks. When he tries to back he cannot get his hindlegs back so goes down on his haunches and falls over on his side. Some other colts afflicted the same way got all right when grass came. He has been on good grass since it began to grow and has always had a good appetite."

Reply—An injury to the spinal cord causing pressure, might cause such symptoms. Occasionally they follow lightning shock, or may be symptoms of swamp fever or of forage poisoning The latter disease, or cerebrospinal meningitis, however, commonly is acute and proves fatal. If the correspondent cannot have a veterinarian make the necessary examination to determine the exact cause in order that appropriate treatment may be prescribed, we should advise him on general principles to give the colt a half-dram of iodide of potash in water night and morning for five consecutive days a week for two weeks. If a deep-seated abscess can be found it should be opened for liberation of pus.

For Perfect-Conditioned Work Horses Use EMPIRE Horse Feed!

A good work horse is worth every care. Proper feeding will keep your horses fit-looking, slick, well and ready for the day's work.

EMPIRE Horse Feed is a carefully planned, economical balanced ration that will give you the finest results with work horses.

It is the perfected result of years of experiment and investigation.

Contains only good grains and other first-class ingredients. EMPIRE Horse Feed costs a little more—so does any article of quality. But it is cheaper in the long run and yields the best return for the money.

"Costs More, but—It's Worth More."

POULTRY.

REGISTRATION OF POULTRY.

Provision is now made for the registration of poultry based on egg production along much the same lines as the registration of dairy cows based on milk production. The productive ability of the hen is thus given due recognition and poultry breeders and farmers should endeavor to have as many birds registered as possible. From now on the most successful poultry raisers will be those who can produce the best strains of layers.

The Canadian National Poultry Association has recently adopted a set of rules governing the entry and registration of birds in the Record of Performance. Certain extracts from the Constitution of the Association and Rules of Entry are given to bring to the attention of the public the manner in which birds may be entered for registration.

2. OBJECT

The objects of the Association are as follows:

1. To consider all matters tending towards the improvement and advancement of the poultry industry.

2. To keep a record of registered poultry, and to collect, preserve and publish data, information and documents relating to registration.

3. MEMBERS

1. There shall be three classes of members:

(a) Honorary Members

The Association at the annual meeting may appoint honorary members, but such honorary members shall take no part in the management of the Association's affairs, and their positions shall be purely honorary.

(b) Life Members

Life members shall be those resident in Canada, who have paid a fee of $50.00.

(c) Annual Members

Annual members shall be those persons, associations, partnerships or incorporatied companies, resident in Canada who pay an annual membership fee of $2.00 on or before the first day of January of each year.

6. OFFICERS

1. Directors: The affairs of the Association shall be conducted by a Board of Directors. The provisional Directors shall hold office until the annual meeting of 1923, and thereafter the Directors shall be elected at the annual meeting of this Association by ballot of the members present and shall hold office until their successors are elected.

The representation shall be two Directors from each province and the Dominion Poultry Husbandman and the Chief of the Poultry Division of the Dominion Live Stock Branch. The Directors of this Association shall be known as the "National Paultry Council."

The Board of Directors shall have power to fill vacancies which occur among the officers through death or resignation.

The Directors may delegate any of their powers to executive committee.

2. Executive Committee: The Directors shall elect from among themselves at their first meeting the President, two Vice-Presidents and eight other members. The president, the two Pice-Presidents with two directors shall constitute the Executive Committee. Each Vive-President with four members of the Directorate located respectively in the western and eastern provinces shall form a local executive committee acting in an advisory capacity to the executive. Other Committees may be appointed by the Directors, either from among themselves or the other members of the Association Members of any committee, except the Executive Committee, shal lhave power to add to their members.

14. REGISTRATION OF PEDIGREES

1. A register shall be kept at the office of the Canadian National Live Stock Records known as the Canadian National Poultry Record.

2. There shall be delivered to every person recording a bird a certificate of registration in such form as may be decided upon by the Directors.

4. The Books of Record to be known as the Canadian National Live Stock Records at such time and in such form as decided by the Directors, and shall contain a copy of the Constitution and By-laws.

5. Any person expelled from membership shall not be allowed the privilege of recording pedigrees on the books of the Association.

6. Any member in arrears of membership fees shall not be allowed the privilege of recording pedigrees on the books of the Association at non-members' rates.

7. Any member prohibited from recording pedigrees by any other Association incorporated under the "Live Stock Pedgree Act" shall not be allowed to record pedigrees on the books of the Association.

15. RULES OF ENTRY.

1. The Standard for poultry as adopted from time to time by this Association by resolution shall be the standard used in determining the purity of breeding.

The breeds and varieties comprising the standard at the date of this incorporation shall be as stated in the schedule attached to the original of this Constitution.

2. The following may be admitted to registry:

1. Pure bred females.

Pure bred females of standard varieties and free from standard qualifications which have qualified in the Canadian Record of Performance for Poultry "A" and "AA" as approved by the Minister of Agriculture for the Dominion.

(a) Record of Performance "A"—To consist of the inspectio nof trapnested flocks on individual poultry plants, under the supervision and inspecial of officers of the Live Stock Branch of the Dominion Department of Agriculture.

(b) Record of Performance "AA"—To consist of the trap-nesting of birds by laying contests or laying under Domniion Experimental Farm, Provincial Government or College management and subject to Dominion Experiental Farm inspection.

(c) Qualification Requirements—The minimum record to permit a bird to qualify in the Record of Performance is one hundred and fifty eggs (150) in fifty-two (52) consecutive weeks, the eggs to be of the quality of Specials and averaging in weight twenty-four (24) ounces to the dozen.

2. Pure bred males.

(a) During 1922, 1923, 1924 and 1925 pure bred males of standard varieties and free from standard disqualifications, the dam and dam's dam of which have qualified in the Canadian Record of Performance for Poultry and have been registered in the aCnadian National Poultry Record.

(b) After 1925 pure bred males of standard varieties and free from standard disqualifications, the sires of which are recorded in the Canadian National Poultry Record and the dam and dam's dam of which are qualified in the Canadian Record of Performance for Poultry and have been registered in the Canadian National Poultry Record.

10. No applications for registration will be considered until fees are paid, nor will any number be assigned to a pedigree until every requirement has been complied with.

16. FEES.

Life Membership, $50.00.
Annual Membership, $2.00.
The fee for registration of pedigree is as follows:
To members, birds 50c each.
Transfers 50c each.
Duplicate certificates, 25c each.

PEDLAR'S GEORGE & OSHAWA SHINGLES

give your buildings the most effective protection against lightning. They lock together on all four sides and form a continuous sheet of steel. When properly grounded they deflect lightning harmlessly into the ground. A Pedlar steel roof will never catch fire from any cause. It is stormproof, windproof, rainproof, and will outlast the rafters on which it is placed. The lifetime of service it gives makes a Pedlar Steel Roof the cheapest roof you can buy.

SOME DISEASES OF POULTRY AND HOW TO TREAT THEM.

The one factor of the greatest single importance in poultry management is cleanliness. In order to maintain a flock free from disease, it is essential to keep your eye on the individuals in the flock all the time and thus be able to determine immediately any abnormal condition or evidence of disease should it appear. A

CENTREVILLE - - - - N. B.

loss of appetite, digestive disorders, diarrhoea, eye or throat trouble, or any other suspicious condition should be immediately noted, the trouble determined, and prompt measures taken to check it. The removal of the cause in a normal flock will usually be sufficient. In instances of serious infections of a roupy nature, which may be exaggerated by bad weather, flock treatment may be necessary to effect a cure. If a diagnosis determines the presence of a serious contagious condition, all affected birds should be immediately removed and their quarters thoroughly disinfected. In such cases it is the safest plan to kill and burn all infected birds.

Clean birds are those which are free from body parasites. Lice and mites sap the vitality of the fowls, lower their normal resistance to disease and check their production due to the unnatural irritation. Loss of appetite and loss of weight follow severe attacks of these parasites. Here again prevention is easier and better than eradication. Clean dust boxes, where the birds can roll and dust themselves in dry fine soil will help to hold them in check; but it never effects entire control. Solium fluoride properly applied will completely control these pests.

Ridding Poultry of Lice.

Sodium fluoride costs about 30 cents a pound, one pound being sufficient to treat 125 birds by the dry powder method, which is to be preferred to dipping. Sodium fluoride is a stomach poison, killing all types of lice which are found on the plumage of poultry. The pinch method of applying the powder dry has been found to be very parid and efficient. This method consists of holding the bird with the left hand, by the wings, while with the right hand a small pinch of the fluoride is taken from a convenient dish and placed in the region of the vent, one beneath each thigh, one on the wattle at the base of the neck and one on each hip.

One treatment will eradicate all lice of all types, including those which hatch out after the application.

Sodium fluoride is absolutely non-injurious to the fowls, eggs or chicks. It does not stain the feathers.

It is a very cheap and efficacious method of lice eradication.

The Importance or Clean Food.

Unlike the lice, the red mites are blood-sucking insects. They are very tiny, and straw-colored when empty. In the daytime they live in the cracks and crevices in the roosts, rests and dropping boards. They appear as thick red dust, which, if watched for a moment, will be seen to move very rapidly. Because of this habit of leaving the birds during the daytime, it is particularly easy to control them. All infested places hould be painted with some material which will kill these parasites. Gas tar, a by-product in the manufacture of illuminating gas, or any one of the commercial wax perch paints are very satisfactory for this purpose. The material used should be painted on the perches, and all other places which are likely to become infested, in sufficient quantity to penetrate the cracks and the grain of the wood.

There is one other form of mite which often does considerable damage, and that is the scaly leg mite. This insect is very common in farm flocks and can be controlled by dipping the legs of birds affected in crude oil. One or ,at the most, two treatments will always effect a cure, if taken before permanent damage has been done to the bird's legs.

Too much cannot be said in favor of feeding our poultry nothing but clean, sweet, wholesome grains and by-products. The old-time practice of feeding the barn-yard flock anything and everything that was not fit to feed to any of the other live stock has passed. We know today that the hen has one of the most delicate digestive systems of any of our live stock.

The birds of the laying flock, of necessity, must be confined during the greater part of the winter. This means the necessity of keeping their quarters absolutely clean and sanitary, if they are to be kept healthy. There are four very necessary operations which go to maintain clean poultry houses:

First, do not fail to have a general house cleaning at least twice each year, spring and fall, just as mother used to do. If the weather is bad and disease appears, additional cleaning will be necessary. During this cleaning everything movable in the pen should be taken out, swept clean and exposed to the sun and air for a number of hours. Remove all the litter and sweep the interior of the house clean. H. R. L.

POULTRY SUFFER FROM ROUP.

Tell me what is wrong with my hens; their eyes swell up and run matter and they are blind for days. Their heads are swollen. J. B. M.

Ans.—Your poultry is suffering from roup, and as this is contagious it will therefore be necessary to remove all the well birds from the sick ones and from where the sick ones have been. All that are badly affected should be killed and the bodies burned, and the house and parts where they have been thoroughly disinfected. It will not be safe to put well chickens in the house for at least three months after the disease has been stopped.

In the early stages of the disease, mix one teaspoonful of common baking soda with four ounces of water. Shake up well and inject a little into each nostril, then inject a little peroxide of hydrogen. Repeat this treatment twice a day until the parts are well. If the eyelids are swollen, press them with the thumb and finger and wipe off any matter that may exude and use a little of the above lotion.

DON'T USE A SCRUB DAIRY BULL

The longer you use a scrub dairy bull the less money you will make. On the other hand, the longer you use a pure-bred dairy bull the more money you will make. This fact is brought to our attention by the results of a survey on 577 dairy farms in northern Illinois in 1912.

Effect of Bull on Labor Income of Owner.

	Labor income Bull used 1 to 5 yrs.	Bull used 5 to 10 yrs.
I. Pure bred bulls used	$799	$1102
II. Grade bulls used...	404	732
III. Scrub bulls used...	198	—243

Those farmers who used a scrub bull from 1 to 5 years ha da labor income of only $198; less than a hired man's wages. When they used scrub bulls from 5 to 10 years they were actually $243 in the hole. They paid $243 per year for the privilege of milking a bunch of scrub cows and doing their other farm work.

Now study the results of those farmers in Group I. who used pure-bred bulls. Notice that when pure-bred bulls were used 1 to 5 years the farm labor income was $799; more than double a hired man's wages. When pure-bred bulls were used 5 to 10 years the afrm labor income was $1,102, which was about three times a hired man's wages.—E. M. Clark, Illinois College of Agriculture.

The accredited herd system is away to a good start in Canada, and a large number of herds have been put under the test. In the United States the work has progressed rapidly. Approximately 30,000 herds are now under federal supervision. Minnesota leads with 413 accredited herds.

We have not yet heard of any county in the Maritime Provinces boasting of having gotten rid of the last scrub bull within its boundaries.

If you are not in a position to show your stock at the large fairs, patronize the local fairs, thus assisting in making the show of greater value.

Kill them all, and the germs too. 10c a packet at Druggists, Grocers and General Stores.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

THE SUN BREAKS THROUGH

In farming there's an adage true,
That never has been known to fail.
It's Nature's heritage to you,
An ever new, yet ancient tale.
For every cloud that's in the sky;
For every day that's dark and drear
A sunny one comes drifting by,
The brighter ones are always near.

A LOVE FILTER

Sally Brimmer did not know about the surprise party until mid-afternoon Fanny Carr ran in to ask her and to see if she would bring a fruit salad—"We've got plenty of everything but that."

"I don't feel very well," Sally replied. "I've taken cold somehow, hanging out the wash probably. But if I don't go I'll send Lex with the salad."

"Well, don't put yourself out," Fanny said. "We'd like awful well to have you come. It's their seventeenth anniversary."

"I know it," Sally sighed. "They were married about the same time we were."

She was certain Lex would want to go so she ironed his best shirt, the one with the fine blue stripe, and brushed and laid out his best clothes. Then she went out to the grocery and bought oranges and gelatin for the salad. She also bought a can of finan haddie for Lex's supper; he was so particular what he ate. Incidentally she thought about the Wilson surprise party. She wanted to go, but she did not feel able.

The salad was a translucent mould and the finan haddie was creamed to perfection when Lex came home from his work. Lex Brimmer was a nice-looking man of the red-brown type. He had curly hair and handsome eyes and a trim little moustache. Sally admired her husband very much and she was not ashamed to show it. When she told him about the surprise party he laughed.

"Well, well, that's one on Abe Wilson. He was telling me today that he didn't believe a soul outside of him and Lucy remembered that it was the seventeenth anniversary. He will be surprised for a fact. You going to take anything?"

"Im going to send a fruit salad by you and I gave Fanny a quarter toward buying them a present."

"But you've got to go, too. Say, you must. Why, I can't go without you. If you don't go I shan't and we owe it to the Wilsons to be there."

The disappointment and dismay in Lex's tone played upon Sally's sympathy. She decided to overlook her stuffy nose and aching head and go. After supper she washed the dishes while Lex read the evening paper. Then she went to get ready.

Sally was the old-fashioned daughter of an old-fashioned mother. She had been carefully trained—first in the duty of a child to its parents and then in the duty of a wife to her husband. For seventeen years she had given her whole time to making Lex comfortable and happy. The more she did the more he demanded. Sometimes it occurred to her that he was selfish, but then all men were selfish Her own father had been most exacting. She had learned from her mother how to efface self for the sake of being an exemplary helpmate. 'The heart of her husband doth safely trust in her,' was the goal toward which Sally strove with every sacrfiice she was capable of.

As a consequence, she had nothing suitable to wear to the surprise party She had wanted a dress for some time but the house had needed certain repairs and Lex had had to have a new overcoat, so she had waited. Her own black dress was all she had to wear, and she did not look well in black. If she had dreamed of going to a party she would have crimped her hair. She had no time now for anything more than a hasty toilet.

Lex did not give her a glance as she came forth in festive panoply. He simply assumed the burden of the salad and they set forth together.

It was a crisp, cold February night with a moon. The snow crunched under their feet as they stepped fast toward Whipple's grocery where the crowd were to meet, proceeding from thence in a body to Wilson's house. There was already quite an assembly when Lex and Sally arrived, muffled women and men with parcels, all laughing and talking together. Sally and Lex were joyfully greeted.

"So you got out after all!" Fanny Carr cried to Sally. "I'm glad. The more the merrier."

"So am I," said Mrs. Cobine. "It won't do no harm, Sally, be sure of that. I've been all but down sick for three days, but I said to myself I was going to Lucy Wilson's surprise or know the reason why."

Fanny nudged Sally.

"Who's that woman talking to Lex?

Sally turned with a start. Lex was no longer by her side, but at some distance talking to a fashionable woman in a fur coat.

"I don't know," she said wonderingly.

"Why, yes you do," Mrs. Wakeman spoke across her shoulder. "That is Eileen Lebar. You remember Eileen? You must. Lex went with her before he ever met you, Sally."

"Oh yes" Sally said faintly. "I remember now. How does she come to be here?"

"Why, she's visiting Kate Cole and Kate brought her to the surprise party. There. They're beginning to start. You better come with me, Sally. I see Lex's going with Eileen" said Mrs. Wakeman, tactless and downright, caught Sally by the arm.

So they came to the Wilson house and bursting in had made a great clamor only to find everything in read iness for them. Mrs. Wilson had on her best dress and Mr. Wilson had on a clean collar. There was warmth everywhere and the twist of a button produced lights.

"Somebody told 'em," whispered Mrs. Wakeman disgustedly into Sally's ear. "That's always the way. We might have known it."

In the bedroom upstairs Sally was accosted by Eileen.

"I don't suppose you know me, Mrs Brimmer? But your husband and I used to be good friends. It seems like old times to see him again and all of you. I've been away for so long, ever since my marriage. I just arrived today and at first I thought I was going to be too tired to come to the party, but I made up my mind that it would be a splendid chance to see everybody and it is!"

She spoke rapidly, snapping her dark eyes and curling her fresh lips. She was pretty in a way that made you think of artificial roses, and her dress was one sparkling mesh of jetted lace and satin. Nothiug so wonderfully stylish had ever been seen in the town unless indeed it were the wax lady as a decoy to the vain and moneyed feminity. Sally felt an increasing awe of her. She hardly knew what to say. They happened to be standing before the bureau and the large mirror repreated them with cruel accuracy. Nothing could have been more unlike than the black of the dresses or the color of their faces. Sally saw and shivered. Eileen saw and smiled wider. She put her arm through Sally's and drew her downstairs to where Lex was waiting.

"I've been telling your wife that you and I are old friends," she said, gayly.

"Sure," grinned Lex, looking delighted. "We are."

At that moment Fanny Carr came and drew Sally away leaving Lex and Eileen together.

They were together the whole evening and they had a very gay time. They seemed charmed with each other. Sally saw them and her heart grew heavier and heavier. She was too miserable for concealment. She tried to talk and smile but she made such poor work of it that she was sure the other women guessed what she was undergoing. She saw them glancing first at Eileen and Lex and then at each other and she knew what these looks meant.

But the party, like all things, came to an end. Mrs. Cole took her gay guest in one direction and Sally took her husband in another.

"My, how good looking Eileen's got." he exclaimed. "She's improved wonderfully. And wasn't her dress pretty? They say that fellow she married gets a big salary. He'd have to with her. I knew I could never earn enough to support her."

"Perhaps you could earn more if I obliged you to." Sally said grimly.

After that she retired behind her conscience while he whistled thoughtfully.

After reaching home Lex went unconcernedly to bed while Sally saw to the kitchen fire and set bread against tomorrow's baking. As she worked she thought about Eileen and after she had fallen asleep she dreamed about her.

She was patching a pair of Lex's every-day pants the next afternoon when upon glancing out of the window she saw Eileen coming up the walk. With a gasp Sally sprang from her chair and tucked the pants under the couch again, but one of the legs refused to be hid, and Eileen saw it as soon as she entered.

"I came because I knew I wouldn't see you again else," she said. "I'm going back tomorrow. I'd like to stay longer but I don't feel I can now. The truth is, I find everything so different it's sort of heartbreaking. Why, even Kate isn't the same. Or Lex, or anybody. I suppose I'm not the same either or I wouldn't feel that way. But after having lived in the city seventeen years you must know I find a place like this pretty dull."

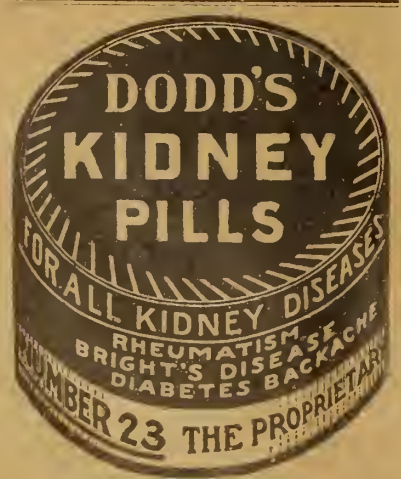
"Of course you do," Sally replied. She did not know what to say.

"Do you know I took a read fancy to you last night? " Eileen went on. "You may have heard I used to go with Lex before you came to town. We never got along some way, though we liked each other well enough. But you've got to have something besides liking to marry on. He seems like a nice man, but I'm going to tell you something." She leaned across her knees to get nearer to Sally. "You're too good to him. And it don't pay. You can work yourself to death for your man and the most you'll get out of it is wrinkles and gray hairs. The harder you work for him, the homelier you grow and that's all the thanks you get for it. You'd be real pretty and taking if you took more pains with yourself and it would make a lot of difference with Lex. You know how it is with yourself when you're looking at a flower bed; you don't gaze long at the faded blossoms; your eyes just naturally goes to the best bloomer and lingers there. You see what I'm trying to point to you Sally? I suppose you're madder than fury at me, but I can't help it. I couldn't go away without telling you some things that were for your own good."

"Wait! Don't go yet," she said, breathlessly. "I want to give you a cup of tea—and a cruller. I made some fresh this morning."

Eileen sat down again. Over the crullers and the tea they talked long and earnestly together.

The next day Miss Foster at Green & Daly's was astonished to sell a



Greatly Troubled With Weak Heart.

Through one cause or another a large majority of the people are troubled more or less, with some form of heart trouble.

Mrs. James Blair, Maynooth, Ont., writes, under date of January 2nd, 1920: "I feel it my duty to let you know how much benefit I have received through using your Milburn's Heart and Nerve Pills. I was greatly troubled with a weak heart, and I doctored with three different doctors, but as soon as I stopped their medicine I was as bad as ever. I purchased four boxes of your pills last spring, and I had not taken two of them before I began to feel better, and after using the four I have not been troubled since."

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken so as to regulate and stimulate it, and this being done the whole system will be restored to a normal, healthy condition.

piece of white serge to Sally Brimmer. But she was no more astonished than they were at the drug store to sell this same Sally a tube of cold cream and a package of pink rice powder.

"Why, you're a real good looking woman, Sally!" he cried. "I declare I'm proud of you. What did you pay for that hat?"

"Beauty comes high," replied Sally calmly. "I paid $7 for it."

He took it nobly.

"Well, I don't care if you did. A man likes his wife to look as well as other men's wives. It ain't to his credit if she don't. Come along. The bell's ringing."

It seemed to Sally that the bell did more than ring as she walked along beside her husband under her new hat; it capered and clanged and accomplished all sorts of tonal gymnastics. But Sally's heart kept time to it for she was wonderfully happy.

WHY MOTHER DIDN'T VOTE

There were to be some little pigs in June, so father said, but they did not materialize, and feed was so high he began to complain when there was no return in view, so mother said she 'sposed he'd better kill the sow. She did hate to lose it too, it was a great disappointment to mother, but seemed better than hearing father grumble. He was quite pleased at the prospect, "can't see ahead enough to realize the loss," thought mother.

A few days later, the bag of feed nearly gone, mother asked him when he was going to do it.

"I don't know how I can kill one as big as that," he said. "It will be an awful job; how would you do it?"

"The same way as you'd kill a small one, I suppose," said mother.

"It'll be an awful job," repeated father. "I don't know how I'll do it —how would it be to shoot her and then bleed her?" He looked at mother, beaming over his brilliant idea.

"That's how they kill them all, isn't it?" said she.

"Is it?" said father.

"Didn't you know that," said mother "No."

"Then I know more than you about that, anyway," mildly rebelled mother.

Father kept on about what a job it would be. Mother thought "that means hiring a couple of men, I can see, more loss!"

Well, father got two neighbors to help him, and they killed the sow on Thursday evening, father pottering round like a hen whose duck chicks have just found the pond.

On Friday morning he began to cut it up; mother watched awhile, then went to the rescue of the meat.

"Let me see, father," she said. "I've cut up all the pigs I've kept while you were away during the war, and got kind of used to it."

Father got the barrel, and put the pieces in, and was just going to pour a pail of salt on the top!

"The pickle wants boiling, you know," called mother.

"Does it," says father in surprise, "that'll be an awful job, won't it?"

Mother got it done, however.

Of course, she meant to go to vote, but this had been a hindrance, yet on Saturday by getting up an hour earlier, she could have managed it.

Father said he was going in the Ackroyd's car, he didn't ask mother if she wanted to go.

However, she got dinner early, and when father was gone and the dishes washed, she primped up and went to the barn for old Dobbin, to find his stall empty; she went to the pasture, he wasn't there! Much worried, mother went to Ackroyd's and said she feared old Dobbin had got out of the pasture and strayed, "tho' land knows why he should after being here all these years."

Little Bessie Ackroyd told her. "No your 'father' lent him to Wilson's this morning, as their driver has gone lame, didn't you know?"

"No," said mother, he never said a word about it."

"Well now, if that ain't too bad," said Bessie.

JOANNA M. HUDSON

Now He Is Able Resume His Work

WHY ALPHONSE BLAIS GIVES CREDIT TO DODD'S KIDNEY PILLS

Saskatchewan Man, With His Rheumatism and Backache Gone, is Telling His Neighbors of Dodd's Kidney Pills.

Lac Pelletier, Sask., Aug. 29—(Speciel)—Stating that he has been relieved of rheumatism and backache by Dodd's Kidney Pills, Mr. Alphonse Blais, a well known and highly respected resident here, is singing the praises of the old reliable Canadian kidney remedy.

"Yes, I suffered from backache and rheumatism," Mr. Blais said in an interview; "and I spent much money on medicines before trying Dodd's Kidney Pills. After taking several boxes of them I was able to resume my work. Now I am quite well again

"I owe my health to Dodd's Kidney Pills, and I want everybody to know that I am very thankful to Dodd's Kidney Pills."

Mr. Blais' troubles came from his kidneys. That is why Dodd's Kidney Pills gave him such prompt relief. Ask your neighbors if Dodd's Kidney Pills do not help any and all forms of kidney disease.

WHAT CAN BE DONE WITH CRAB-APPLES.

Crab apple trees produce almost every year, and grow in any out-of-the-way corner with little attention. A few trees will supply fruit for jelly and preserves much more cheaply than the high-priced apples on the market. Moreover, the quality is just as good, if not better.

To make crab apple jelly, wash the crabs thoroughly, remove the leaves and blossom ends, cut out the decayed spots and place the apples in a preserving kettle. It is unnecessary to peel the fruit or to remove the cores and stems. Cover the apples ples well with cold water and cook them slowly until they become very much broken. The longer and more slowly they cook, the better will be the flavor and color of the jelly. Pour the apples and juice into a jelly bag, and drain them overnight without pressure.

In the morning measure the juice and add an equal amount of granulated cane sugar. Stir the juice until the sugar is thoroughly dissolved. Pour the sweetened juice into large-sized rather shallow granite kettles, with so little in each that it will begin boiling very soon after it is placed over the fire. Crab apple jelly requires very little boiling. As soon as the juice becomes thick enough pour it into glasses.

A surprihing amount of juice, of course containing some pulp, may be secured by pressing the apples left in the jelly bag. Jelly can be made from this juice also. If this second grade juice is pressed out the remaining pulp should be disposed of, as it is too dry to be palatable. On the other hand, if the juice is not pressed out, the pulp may be made into fairly palatable crab apple butter. Some people consider the flavor of the jelly is delightfully improved if a stick of cinnamon is added to the crabs before they are boiled.

Butter and Pickles.

Crab apple butter is inferior to that made from other apples, but even at that it is very palatable indeed. Wash the crab apples thoroughly, remove the leaves and blossom ends, place the crabs in a large preserving kettle and cover them well with cold water. Allow them to cook slowly until they become thoroughly soft. Remove them from the fire and allow them to cool enough to handle. Empty both the apples and the juice into a granite colander and rub them through it. Place the pulp and juice together in a stone crock with enough sugar to make the butter as sweet as desired; usually about a cupful of sugar to a quart of pulp and juice is satisfactory. Add also cloves and cinnamon to suit the taste. Mix the sugar and seasoning with the pulp and juice, and then place the crock in a moderately hot oven. Stir the butter once ever ten or fifteen minutes. When it becomes thick like mush, seal it in jars.

Crab apple preserves are superior in flavor, shape and color to those made from other apples. Prepare a heavy sirup by b iling together for fifteen minutes sugar and water in the proportion of one quart of sugar to one quart of water. Select perfect, well colored crab apples, wash them thoroughly and remove the blossom ends; leave the stems and peelings. Place the crabs in the sirup and stew them gently until they are well done. lift them out and put them into glass Jars. Unless the sirup is very thick, boil it until it becomes like molasses; then fill the jars to overflowing and seal.

For pickled crab apples select only perfect ripe fruit. Wash the crabs thoroughly, remove the blossom ends, being careful not to break or remove the stems, and put the apples into a preserving kettle with enough vinegar to cover them. Boil them slowly until they become tender, but remove them before they fall to pieces and placethem in jars. Estimate the amount of vinegar necessary to cover the fruit in the jars; measure out this amount, and an extra pint to allow for boiling away, from the liquid in which the crabs were cooked. Add one and half pints of brown sugar for each pint of vinegar, and also a bag containing two sticks of cinnamon and three tablespoonfuls of cloves; boi lthe mixture for thirty minutes. Then pour the boiling vinegar over the crab apples and seal the jars.

TOMATO CATSUP.

Cut one peck of ripe tomatoes into small pieces. Boil until tender, and strain. Add six tablespoons of salt, one tablespoon of white pepper, one saltspoon of cayenne pepper, two tablespoons of cinnamon, one tablespoon of cloves, one teaspoon of allspice, one teaspoon mustard, one pint of vinegar, and one cup of sugar. Boil slowly for three hours. Seal in sterilized glass bottles.

PICKLES.

Wash and thoroughly clean small cucumbers. Fill sterilized jars. To each jar add one tablespoon of salt, one tablespoon of allspice, and fill with equal parts of vinegar and water. Seal air-tight.

PEPPER PICKLE.

Chop twenty-four red peppers and twenty-four green peppers. Pour boiling water on to the peppers and let stand fifteen minutes. Pour off water and repeat process. Add twelve onions chopped fine, two cups of sugar, three tablespoons of salt, and three pints of vinegar, to the peppers. Cook until peppers are soft.

DIARRHOEA TURNED TO DYSENTERY

Lost 29 Pounds.

Dysentery is one of the worst forms of bowel complaint. The pains in the bowels are intense, the discharges occur with great rapidity, and are very often accompanied by blood. It does not need to persist for any length of time until the whole system is weakened and debilitated, and hardly any other disease so quickly undermines the strength and brings about a condition of prostration and utter collapse that often terminates fatally.

To check the unnatural discharge, without bringing on constipation, there is only one remedy to use, and this is Dr. Fowler's Extract of Wild Strawberry.

Mr. G. W. McVagh, Mawer, Sask., writes:—"About eight years ago I had a severe attack of diarrhoea which turned to dysentery before I got better. I might say I was sick for three weeks. I weighed 154 lbs, when I took sick and weighed 125 lbs. when I got it stopped. I think I had tried every medicine that was on the market and did not find relief until I tried Dr. Fowler's Extract of Wild Strawberry, and one bottle relieved me. I think there is nothing like it for diarrhoea or dysentery. I always keep some on hand as a person does not know when he will need it."

'Dr. Fowler's" has been on the market for the past 75 years. Don't experiment with some no-name-no-reputation compounds. They may be dangerous to your health.

Price 50c. a bottle. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

CHUTNEY SAUCE.

Remove seeds from two green peppers. Put peppers with one cup of raisins, two onions, and six green tomatoes through a chopper. Cook for one minute one quart of vinegar, two cups of brown sugar, one tablespoon of powdered sugar, two tablespoons of salt, and two tablespoons of mustard seeds. Combine two mixtures and simmer one hour. Add apples cut into quarters, and cook until they are soft but not broken. Seal in sterilized fruit-jars.

TOMATO AND APPLE PICKLE.

Use twelve tomatoes, twelve apples, and six onions of equal size. Cooke the tomatoes in one quart of vinegar until the tomatoes are soft. Chop the apples, onions, and one pound of raisins very fine. Add to the tomato mixture with which has been combined one pound of brown sugar and one teaspoon of salt. Boil for one-half hour. Add one-half teaspoon of ground cloves and one-half teaspoon of ground cinnamon. Cook five minutes. Seal while hot in sterilized glass jars.

SWEET PICKLED APPLES.

Use tart, well-flavored apples. Wipe and cut into halves. Stick each half with three cloves. Make a syrup using one part sugar to one part water. Use one pound of sugar to two pounds of apples. Put apples into syrup and simmer until they may be pricked with a toothpick. Keep in a stone crock.

'In the land of the free" women are still fighting for federal suffrage. Even Tennessee is getting excited as the time for State ratification grows near.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

Hantsport Fruit Basket Co,. Ltd.

HANTSPORT, N. S.

THE CITY MILK SUPPLY

(Continued from page 843)

3. Milk with dry hands; never allow the hands to come in contact with the milk. The practice of moistening the hands with milk, or to spit on them, is to be condemned.

4. The milker should wear a clean washable jacket, used only when milking, and kept in a clean place at other times.

5. Always brush off and wipe the udder and surrounding parts just before milking. If the cows are very dirty, wash with a cloth or sponge, and then dry the udders and teats with a clean piece of cloth or sacking

6. Milk quietly, quickly, cleanly and thoroughly.

7. The first few streams from ecah teat should be rejected, as this milk contains more bacteria than the rest of the mess.

8. All milk drawn from the cows 15 days before and 5 days after calving shall be rejected, and also all milk from diseased cows. If any accident occurs by which a pail full or partly full of milk becomes dirty, do not try to remedy this by straining, because the soluble filth and the bacteria cannot be removed by straining but reject all this milk and rinse the pail.

9. The pails in which the milk is drawn should have as small as openng at the top as can be used in milking. This renders the collection of manure and dust with the milk, less likely.

10. Dry fodder should not be fed to the cows during or just before milking, as dust therefrom will fall into the milk.

The Milk

1. Remove the milk of every cow at once from the stable to the milk house or to a clean room where the milk cans to remain in stables while milk cans to remain in stables whle they are being filled.

2. A good plan, if modern coolers are not available, is to strain the milk into cans which are standing in ice water which reached the neck of the can.

3. The more rapidly the milk is cooled and the colder it is kept the safer it is, and the longer it will remain sweet. Milk cannot be properly cooled at any season of the year if the air alone is expected to do the cooling.

4. Ice should be used in cooling both in summer and winter, as very few wells or springs are cold enough for the purpose.

5. If aerators or coolers are used, they should stand where the air is free from dust and odor, and so on no account should they be used in the cow stable.

6. Milk should always be cooled as soon as strained. If modern apparatus for airing and cooling at the same time is not at hand, the milk should be aired by tipping the covers slightly while cooling the milk to 50 degrees F. in clean ice water. Precautions should always be taken to see that the water is above the milk to be cooled in the cans, and that the water cannot overflow into the cans and water the milk.

7. Never ship a can containing warm milk which has not been cooled and aerated.

8. If the milk is held at the farm it should be stored in fresh, ice cold water, or kept in a running spring.

9. The milk should be kept under shelter, so that the rain cannot get into the cans.

10. Never mix fresh warm milk with that which has been cooled.

11. Durng the transportation of the milk and cans to the car or dairy covered wagons only should be used. If this is not possible the cans should be protected from heat, cold. dust and mud by a clean canvas or blanket.

12. All milk must be rapidly cooled and continuously maintained at a temperature below 50 degrees F.

(Continued next issue)

POLISHING HORNS FOR EXHIBITION.

How can I train horns and polish them on exhibition cattle? H.H.

Ans. The proper time to train horns is when the animal is young. Then they can be controlled, if patiently handled, by using horn trainers. When using horn trainers care should beg taken not to overdo it and spoil the horns. To polish a coarse, rough horn the procedure is as follows: Begin with a rasp that is rounded on one side and get the scaly parts off. Then scrape the horn with broken glass or a steel scraper. Follow this with emery cloth, and then use an oiled rag with powdered emery on it, finally polishing it with metal polish or powdered pumice stone on an oiled woolen rag. Some show men keep a woolen cover on the horns to protect them.

RIDGLINGS STERILE

L.B.T.—"Can a double ridgling inseminate?

Reply—Where both testicles are re tained in the abdomen the horse is termed a crytorchid and is sterile. He has all the attributes of a stallion however, and will serve a mare, but the fluid ejected will not contain the sperm cells. Where one testicle is retained the horse is termed a monor chid, and may be fertile.

THRUSH

I have a horse whose frog seems to rot away. The stables are kept in fine condition with plenty of clean straw. What is the best thing to do for him? Some call it thrush.—G.E.W

Thrush is characterized by a discharge of thin, foul smelling fluid, from the cleft of the frog and is caused, as a rule, by standing in wet and filth. Cleanse the frog and cut away all loose or rotten horn and then pack calomel into the cleft of the frog and on each side of it, if those parts also are diseased. Cover with pine tar and oakum or cotton. Renew the dressing daily; keep the stall floor clean and dry.

Poland China Swine

See my exhibit of Poland China Pigs at St. John and St. Stephen Exhibitions. I have three litters for sale at $12 each. Be sure and see me and get one or more.

THE EASTERN KARAKULE-ARABI SHEEP CO., LTD. WINDSOR, N. S.

500 CHEVIOT SHEEP FOR SALE

Consisting of 300 Breeding Ewes and 200 Lambs.

This flock located on the south shore N. S. has been bred up from native shore ewes and pure bred Cheviot rams until most of them now have only a sixteenth of blood not Cheviot. They pasture in the open, unhoused, upon the abundant feed of the headland ranges and barrens, summer and winter, requiring help in the way of rough hay only and that only on rare occasions when deep snow remains on the ground for any length of time. Among them are many exceptionally fine hardy breeding ewes and from the lambs of this year excellent service rams can be selected. The purchaser by arrangement can have nutil January 1st, 1922, to remove them with free use meanwhile of the ranges, houses and necessary equipment. If purchased for slaughter, beginning with yearlings now ready for market, the whole flock will be in condition upon pasturage alone to market before next January, except a few backward lambs which either will do for feeders to be disposed of during the winter or may be left over to market next year.

For further particulars and inspection inquire of

WHAT A FEW OF OUR CUSTOMERS WROTE US LAST YEAR:

Wallace Machine Works Limited,
Sussex, N. B.

Jeffries Corner, Kings Co., N. B.
Jan. 30th, '20.

Gentlemen:—

As you know, last fall I purchased one of your No. 2 Little Giant Threshers and it gives me much pleasure to tell you we have had excellent satisfaction. We found the machine all and morethan you claim it to be. Most of our barns being small, we had considerable moving to do over a rough country, we had no trouble whatever to thresh and clean sixty bushels and more of oats per hour. I had such good luck with your machine that my brother decided to buy one and I know that he has had the same satisfaction that I have had. I have nothing but the highest praise for the Sussex Little Giant and would recommend them strongly to anybody thinking of purchasing a machine.

Wishing you every success, I remain,

Yours truly,
MURRAY VIRTUE.

Apohaqui, N. B., Oct. 1st, '19.

Wallace Machine Works Limited,
Sussex, N. B.

Gentlemen:—I purchased one of your No. 2 Threshers this year and I must say it is giving me excellent satisfaction. Only last Saturday I threshed at Wm. McLaughlin's, Parlee Sett., 431 bushels of grain of which was 212 bushel of buckwheat, 26 bushel of barley, and 193 bushel of oats, from 7.30 in the morning until 5 in the afternoon allowing one hour for dinner, and as we only had bags enough to hold 80 bushels we had to stop after threshing this amount each time and empty.

I did this without hurting my machine in the least and cleaning the grain in good shape.

Wishing you every success, I remain,

Very truly yours,
JOHN ARMSTRONG.

Hebron, N. B., Dec. 26th, '19.

Wallace Machine Works Limited,
Sussex, N. B.

Gentlemen:—

The two horse power thresher I bought from you this fall is a dandy, the best we have ever used. Have threshed one hundred bushels in one hundred minutes. Every one we threshed for said they never had such good satisfaction. There are several machines around here but I guess they will all have to take a back seat next fall.

Wishing you Success and a Happy New Year, I remain,

Yours truly,
KINNEAR HOAR.

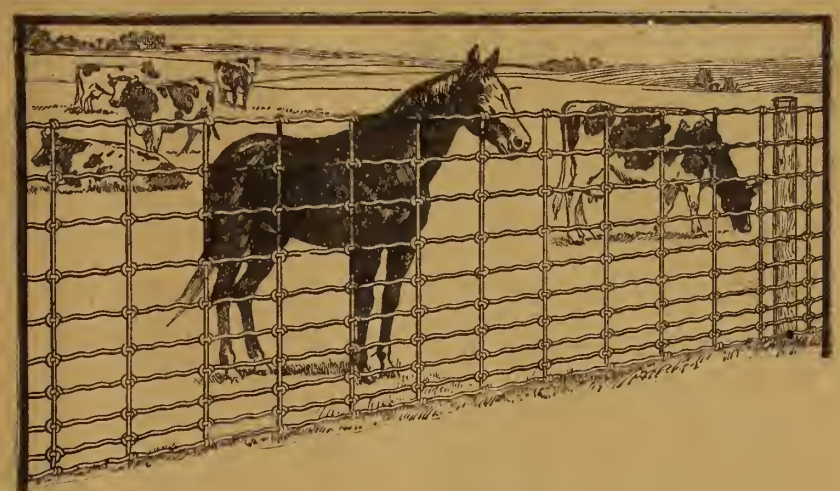
Vol. 25 SUSSEX, N. B., SEPTEMBER 14, 1920 No 25.

Maritime Fences

Stand the Strain of Man, Beast and Weather



The Maritime Fence is made of extra heavy, hard drawn steel wire of 9 gauge. Each Fence is rigidly tested in our factory, so we know that they have more strength than they are ever likely to need.

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime fence is far longer---and it's wear value much greater.

On the extra quality wire we put a smooth, even, heavy coat of galvanizing.

We put on more than enough, so that the greatest strains of time and weather will not impair it. We lock laterals and upright wire rigidly, yet springily with a cross leverage lock that simply cannot let go under the hardest strain. The superior stretching power of No. 9 wire keeps the strands from snapping in the severest frosts.

A Maritime fence is of lasting strength, sightly appearance, and is a necessary improvement on all Canadian farms.

For sale by agents and dealers in nearly every section.

If you don't know the dealer write today to

MONCTON, NEW BRUNSWICK

MARITIME WIRE FENCE

They All Use

En-ar-co Motor Oil

The Supreme Test

During the war En-ar-co Motor Oil fulfilled the exacting demands of powerful airplane motors, where absolute smooth-running *must* be ensured. Thousands of gallons were used in army airplanes.

To-day, thousands of farmers are finding it indispensable for their tractors, automobiles, trucks, stationary and other engines.

Scientific Refining

Scientific processes carried on by trained workmen produce En-ar-co Motor Oil from selected crude petroleum. That is the secret of its perfection.

It coats all moving parts of the engine with a velvety film that withstands pressure and removes friction. That means greatest power and longest life for the engine.

En-ar-co Products Are All Power Getters

White Rose Gasoline
Gives greater power and puts "pep" into your engine.

National Light Oil
Gives a clearer light in lamps and lanterns; steadier warmth in heaters, brooders, incubators. Best fuel for tractors.

En-ar-co Motor Grease
For differentials—gears—transmissions, on motor cars and tractors.

Black Beauty Axle Grease
Takes the grind and squeak out of axles and ensures smoother running and longer wear.

Order En-ar-co Products from your local dealer. If he hasn't got them, write us and we'll see you are supplied promptly.

FREE AUTO GAME

A fascinating game in which autos compete in a cross-country race will be sent FREE to any auto, tractor, truck, motor boat or engine owner who will fill out the attached coupon and mail it to us.

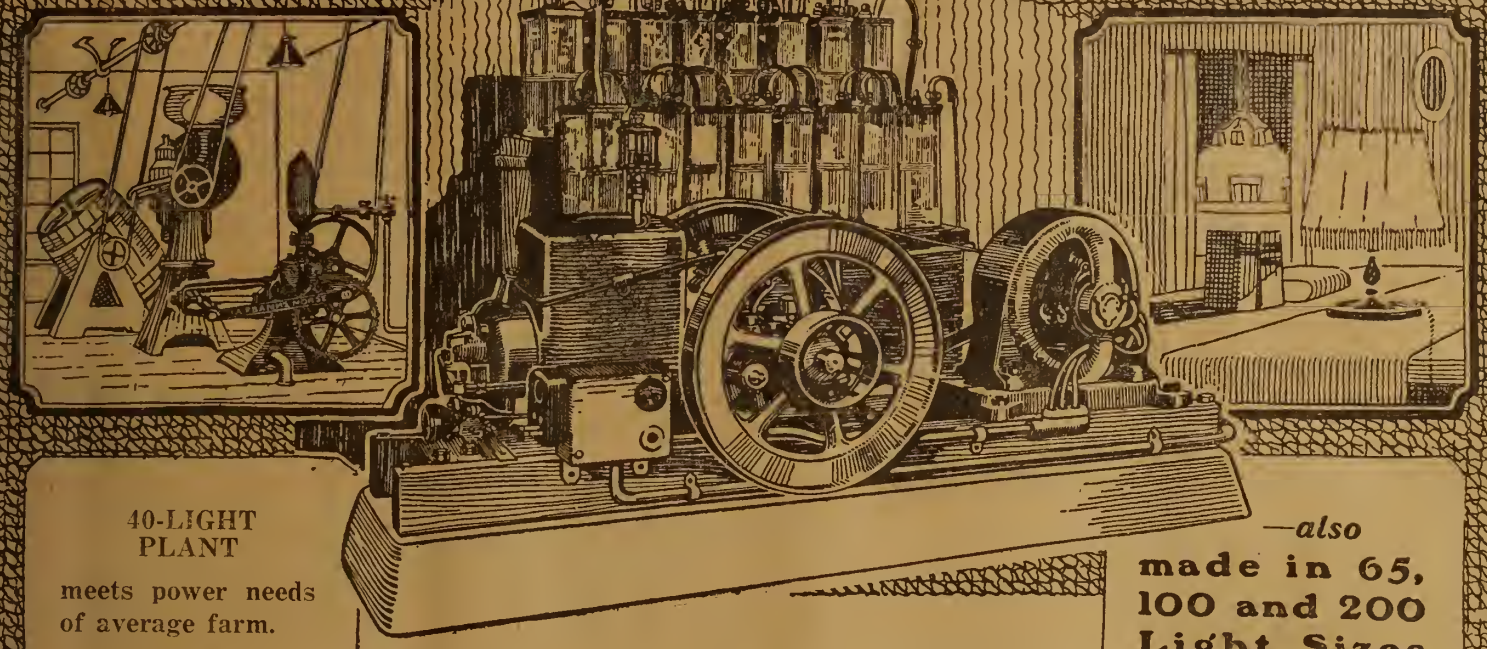
POWER LIGHT



40-LIGHT PLANT
meets power needs of average farm.

—*also* made in 65, 100 and 200 Light Sizes

You will never go back to Oil Lights after you have seen the advantages of the

"F" Power & Light Plant

TOUCH A BUTTON!—Instantly a flood of brilliant light in house, stables, cellar, garage, or barnyard. Better light—less cost. No lamps and lanterns to fill and clean. No groping in dark corners or unlighted stairs. Bright clear light, wherever you want it. Dependable, convenient, economical.

Power also at your command. Direct belted to your separator, churn, pump, grindstone, or washing machine, the "F" plant engine does as much work as an engine twice its horse power, producing current to drive these same machines by individual electric motors. The "F" Plant is a farm utility which gives you, dollar for dollar, more comfort, convenience and profit than any other farm improvement. It is a time-saver and a labor-saver.

Install an "F" Power and Light plant now and enjoy the advantages it makes possible. You will immediately benefit, and find greater pleasure and satisfaction in your home and on your farm.

Mail the coupon to our nearest office, to-day, and the "F" Plant catalogue will reach you in a few days, giving complete information.

THE AGRICULTURAL COLLEGE

Truro, Nova Scotia

Next Session Opens Nov. 2, 1920

FREE TUITION TO STUDENTS FROM THE MARITIME PROVINCES.

Instruction given in all branches of Agriculture and the Sciences related to Agriculture; also English, Mathematics, Bookkeeping, Economics, etc.

The Course is of two terms duration, November to April each year, leaving all summer for work on farm.

Graduates of two year Course may enter the third year at Guelph, MacDonald and other Canadian Agriccltural Colleges and obtain the B.S.A. degree in two more terms. Previous graduates have regularly stood at the top of their class at these Institutions.

Write to undersigned for Calendar giving full information.

SAMSON

Model M Tractor

The Tractor for All Year Use

If you will judge the Samson Tractor by the value of its utility you will quickly appreciate why so many farmers in the locality have purchased them. The Samson Model M is more than just a power plant for plowing or silo filling. It can be utilized nearly every month of the year. It will save you money in nearly every operation of your farm work.

In the Spring, the Samson is the ideal machine for seed-bed preparation. It pulls a two- or three-bottom plow—a tandem disc harrow—two twenty-foot spike-tooth harrows—two four-horse grain drills. In the Summer, the Samson makes easy work of threshing. In the Fall. it will furnish all the power for silo filling, harvesting and be ready to do an early job of Fall plowing.

In the cold weather. the Samson is right on the job for wood sawing and all other heavy duty winter belt jobs.

FEEDING MILK IN HEN-HOUSE.

Sour milk is often wasted by feeding it to poultry in small shallow pans. The birds step on the sides and tip them over and much litter is scratched into the milk. Unclean milk is a cause of digestive troubles in poultry. Earthen crocks are the best receptacles we have found for feeding four milk. They can easily be scalded and they are heavy enough so that the birds cannot tip them over by standing on the edge.

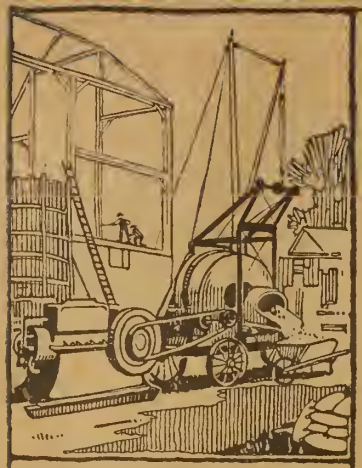
In the winter the crocks can be placed on low wooden benches in the laying house to keep them free from the straw litter. About three gallons of sour milk per day seems about right for a farm flock of one hundred hens. Sometimes a few of the birds will show little interest in the milk. By mixing it with dry mash for a few days they will learn to like it. We often mix the sour milk fed to young stock with the growing mash and this gives all of the pullets a chance to receive a share. There is no feed that is better to stimulate growth and keep the young pullets healthy and vigorous.

The birds use milk to the best advantage when it is always fed sweet or sour. A frequent change from one to the other seems unhealthful. As milk is apt to sour in the dishes before it is used it pays to always use sour milk. We keep a large crock containing sour milk at all times and the sweet milk emptied into this crock soon sours. At least once each week the large supply crock should be scalded so there will be on chance for a mouldy scum to form around the edges. By keeping at least a small jar of sour milk for a culture it is possible to sour pails of sweet skimmilk in a short time. H. A.

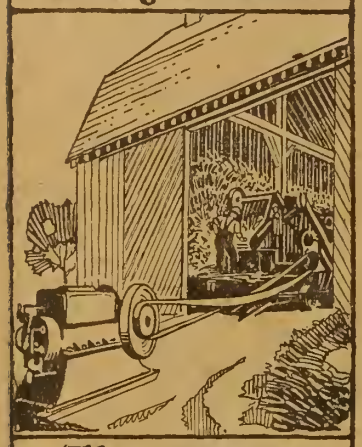
COW FAILS TO BECOME PREGNANT.

I have a cow that had a calf 19 months ago that comes regularly in heat. She was pastured last season with other cows where a bull is allowed freedom. She is still giving milk. What is the trouble and what would you advise? W. F. M.

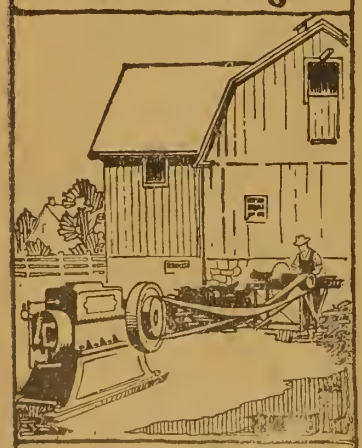
Mix an ordinary cake of yeast to a paste with a little warm water and allow it to stand twelve hours in a moderately warm place, then stir in one pint of freshly boiled water, and allow to stand for another 8 to 10 hours. The mixture will then be ready for use, and the entire quantity should be injected into the vagina. Use the mixture when period of heat is first noticed and breed when period is about ended.



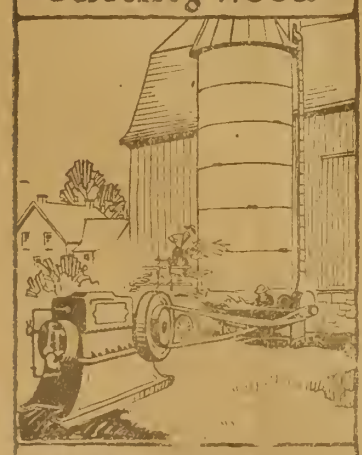
Mixing Cement



Threshing

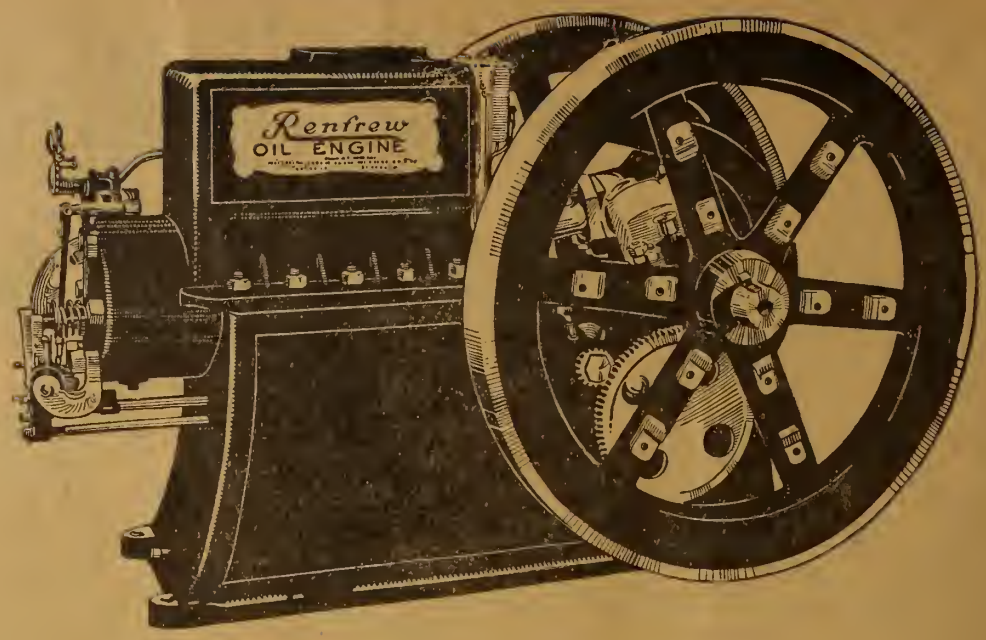


Cutting Wood



Filling Silos

The above are only a few of the uses to which this marvellous engine can be put on the farm. As a money, time and labor saver it has no equal. It will perform any task that an engine can.



A Steady Worker and a Money Saver

With no electrical ignition system, no carburetor, no magneto, no batteries, no coils and no wires to worry and give trouble, burning the cheapest fuel oil obtainable and *absolutely* dependable in all weathers, the Renfrew Oil Engine for the farm is far superior in every way to all other engines.

The fire hazard is greatly minimized because it will not burn gasoline. It effects a remarkable saving in fuel cost. Indeed, we estimate that on an average a Renfrew Engine pays for itself in a year, through this saving in fuel. It burns any cheap fuel, from coal oil (kerosene) down to fuel oil. It does not require expert attention, and all working parts are easy to reach. The

Renfrew Oil Engine

is built to suit the needs of the Canadian farm. It is sturdily built, lives long, and gives consistently good service. It is just the engine that is needed on thousands of Canadian farms. Write for our catalogue and instruction book, in which you will find the whole simple truth about the Renfrew Oil Engine.

Volume 25. SUSSEX, NEW BRUNSWICK, SEPTEMBER 14, 1920. Number 25.

The St. John Exhibition

The first exhibition in the Miritime circuit of fall fairs for 1920, was held at St. John, N. B., under the auspices of the Exhibition Association of the City and County of St. John, from September 4th to 11th.

This was the first exhibition held by the Association since the signing of the armistice. Their last fair was held in 1914 and during the six years that have intervened the grounds and buildings have been utilized by the military authorities.

The merchants of St. John and many of the manufacturing concerns of Canada who have representatives in the Maritime provinces, made good use of the excellent opportunities offered by the exhibition to display their wares. Every availqable foot of space in the spacious buildings was taken. The tastily arranged booths that ranged along the walls and in the centre of the main building presented an attractive appearance. Lack of space does not permit a description of the various displays.

The official opening was presided over by His Worship Mayor Schofield, who in the course of his remarks presaged the possibility of the fair being made an annual event.

Hon. W. E. Foster, Premier of the Province, as a director of the exhibition in pre-war days, congratulated the management on the splendid showing the present board had made in putting the buildings and grounds into such excellent shape. He eulogized the benefits that accrue from the fine community spirit that exhibitions generate and the splendid channel they offer for the instilling into the minds of our own young people the magnificent and numerous resources of our province. The first official announcement of the government's plans re the development of the water powers of the province was made by the Premier at the opening exercises of the exhibition and was heartily cheered by the audience, who were quick to see the important developments that are sure to follow in the wake of such an agressive, progressive policy. Premier Foster said his ambition was to build up New Brunswick agriculturally and industrially, for the benefit of those living now and to offset all the inducements that might be offered the younger people in other provinces.

Hon. J. F. Tweeddale, Minister for Agriculture, congratulated the management on the good showing that was staged at the fair and pledged his support for any progressive undertakings they might in future participate in for the benefit of the province and its people, a people who when the call to arms and to produce had come marched forth as armies to the front trenches as well as to the second line of defence on their farms where food in abundance was produced that our armies and Allies might be fed. He enumerated several feature in connection with the department over which he presides which went to show that his is a dpartment that plans and works with and for the best interests o fthe farmers of the province.

In a brief and pithy speech, Hon. Dr. W. T. Roberts, Minister of Public Health, congratulated the women committee members for the splendid showing that was made in their department. The work of the province during the dark war days had been explained by the preceding speakers, he said, but he asked the public to remember that without good health all the war activities of the provincial people would have been impossible. The fact that 250 out of every 1000 babies born, die before the end of the first year, and the thousands of people in the province who die each year from diseases that are preventable, should be an incentive for all good thinking people to put forth every effort to stay the hand of the grim destroyer. Dr. Roberts said his efforts at present were particularly along the line of chil welfare, for the children of today would be the young womanhood and young manhood of tomorrow. The present health exhibt had been thought a necessity by the department of public health and he heartily thanked the women who had helped in its arrangement.

Mrs. G. A. Kuhring, who had charge of the women's work and public welfare exhibit, asked the visitors to study well the various educational features they would find displayed in the department over which she had charge, as well as other features equally commendable.

The Lieutenant Governor, Hon. Wm. Pugsley, in an address brimming over with optimism for the future of Eastern Canada, declared the exhibition formally opened.

The Maritime Farmer representative has attended every show of any consequence that has been held in the Maritime Province for the past fifteen year, and he reports that outside the magnificent agricultural and live stock displays that have been made at some of the fairs which he has vtsiied, no feature has ever appealed more to him than the display put on by the Public Health Department of the New Brunswick Government and its coworkers at this year's St. John Exhibition. Would that every man, woman and child in the province could have visited the various booths of this educational display and profit from the splendid, instructive demonstrations there given and carry with them through life for the saving of young life, that splendid asset of our country, the tenets so tastily depicted on the "Silent Teachers" placards that were conspicuously displayed in the various booths.

Some of the features dealt with in the Public Welfare exhibit included: "Home Care of Baby," with baby clinic, Parental Care and Better Obstetrics, Little Mothers, Baby Diet, 1 to 12 months; Baby Diet, 12 to 24 months; Pre-School Diet, 2 to 6 years; Nutritional, Tuberculosis, Oral Prophylaxis, teeth, tonsils and adenoids, Recreation, Social Hygiene, Extermination of Common House Fly, Alcohol, Patent Medicine and the Baby, Kindergarten, Housing and Sanitation, Mental Hygiene, Blind. Physicians, Specialists and Dentists, recognized leaders in their profession, were in attendance. The Daughters of the Empire, the Red Cross, the St. John Ambulance Brigade, the Anti-Tuberculosis Association and other well known organization members heartily co-operated to make the child welfare exhibit the best ever staged in Maritime Canada.

Another feature that appealed to the representative of the Maritime Farmer was the display of the Natural Resources of the province of New Brunswick, staged under the able direction of Dr. Wm. McIntosh, Curator of the Natiural History Society's Museum, St. John, under the joint auspices of his association and the Department of Lands and Mines of the province.

Many and varied are the province's resources, many of which were for the first time brought to the attention of the average visitor to the fair. Products and by-products of the forest, farm, sea, mine and manufacturing industries of the province were tastily displayed, suitably labelled so that the visitor might glean a fund of information without asking very many questions.

The showing made in the Women's Institute Department where samples of the Domestic Arts and Crafts were shown reflected a great deal of credit on the splendid work that is being done by and for the women of the province through the agency of Women's Institutes.

The Horticultural, Poultry and Agricultural Division of the New Brunswick Department of Agriculture helped make the Agricultural Hall, which was not too well filled with products of field, orchard and garden, a centre of attraction.

The showing of agricultural products was fair but not at all representative of what could be shown under more favorable conditions so far as freight and labor are concerned. We have seen heavier displays at some of the county shows; yes, at the St. John county show. The market gardeners within a radius of six miles of the city of St. John could have made a display if they felt so inclined that would have been an exhibition worth while. A perusal of the list of prize winners shows that the majority of them in this department were from Kings County and up-river points and from Nova Scotia.

A. C. McCullough, the popular progressive poultry superintendent for the province, was kept busy at his dispaly answering questions re how "the hen is the only one that can lift a mortgage by just laying around." Hens and chicks, model poultry houses, incubators, and other poultry appliances constituted the display.

The display of honey, wax, bees and beekeeping appliances staged by Mr. L. T. Floyd, the enthusiastic bee man for the province, was thronged with visitors and the message of the bee and hive was thoroughly explained to all who sought to know something about the mysteries of beekeeping.

The Dominion Poultry Division had a very comprehensive exhibit, displaying the proper methods of caring for eggs and how best to get them to market and to the ultimate consumer in the best condition. The work of the co-operative egg circle, that organization that has done so much for Prince Edward Island poultry and egg producers, was very cleverly depicted.

The Dominion Entomological Branch had an instructive display under the direction of Mr. Geo. E. Sanders, in charge of the aLboratory at Annapolis Royal, N. S. Any questions re insects and fungous pests on fruits and other crops and methods of control received ready answers. One of the features displayed in this booth, and one that should have been carefully noted by every potato grower who visited the booth, was the produce of 100 hills of potatoes that had been thoroughly sprayed, yield 121 lbs., and the product of 100 hills of potatoes that had not been sprayed, yield 60 lbs. Enough said.

Goold's Nurseries, Sussex, had booths wherein were shown some features of landscape gardening for the beautifying of the home grounds. When one reflect on the numerous homes with all too bare surroundings he cannot help wishing that every home owner would put forth every possible effort to improve the grounds surrounding their homes. Many valuable ideas could have been gleaned from the Goold Nurseries display and we trust not a few of the visitors profited thereby.

The exhibit of butter and cheese was quite small, but of good quality.

Horses were also a small entry. The best showing was made in the aged Percheron stallion class, and in the Standard Bred Stalloin class. In the former, Clayton's Indican led the way, with Wallace's Montgomery Ward in the second place and Jewett's Arion in the third money. In the Standard Bred Aged Stallion class, as well as in the Roadster class for aged stallions, the same stallions, viz., The Exposer, Native Worthy, Colorado L. and Border Prince were placed in the order named.

The only Clydesdale shown was Jewett's Dr. McCoy, by Day Dream.

There was a small showing of carriage and roadster horses. Wm. John-

(Continued on page 870)

The Potato and its Cultivation in Canada

By W. T. Macoun, Dominion Horticulturist

The potato is used almost as freely as bread in Canada, and, like that food, is thought as much of by the rich as by the poor. It can be obtained at all seasons of the year, and if properly kept, is about as good at one time as at another. Being one of the most useful food products, its cultivation and improvement deserve the greatest attention.

The potato succeeds well everywhere in this country, where the season is long enough for the tubers to develop before the tops are killed by frost, hence potatoes are cultivated in practically every settlement in Canada, even up to, and within, the Arctic circle.

Although the potato is one of the most important food products of Canada, the methods of culture employed in growing this crop can be very much improved. This article is written for the purpose of giving information to Canadian farmers, which should help them to obtain much better crops than they have hitherto had. The recommendations made are for the most part based on the results of experiments conducted at the Central Experimental Farm during the past thirty years, although the results of the work of other experimenters have not been overlooked, and have also been used when deemed advisable.

In the province of Ontario, where records in regard to the potato crop have been kept for thirty-six years, 1882-1917, the average yield for that period has been only 114.7 bushels per acre. Some of the best farmers in Canada grow from 400 to 500 bushels per acre, and even larger yields are obtained, while 300 bushels per acre is not unusual. At the Central Experimental Farm the highest yield on a small plot was at the rate of 772 bushels per acre, but careful experiments have demonstrated that potatoes can be produced at the rate of over 1,000 bushels per acre. While in field culture such high yields may not be possible, they are something to strive for, and there is no doubt but that the average yield for Canada could be doubled if the best methods were employed by every grower.

Climate and Soil.

The potato appears to thrive best in a moist, somewhat cloudy and temperate climate, but providing there is sufficient moisture in the soil and the growing season is long enough it is not at all fastidious in this respect. It is a little more particular in the matter of soil, but large crops are grown in a great variety of soils. The ideal soil for potatoes appears to be a rich, deep, friable, warm sandy loam wtih good natural drainage, and well supplied with decayed or decaying vegetablt matter. The potato requires a large amount of moisture to develop a large crop of potatoes, and for this reason the soil should be retentive of moisure. Potatoes will not, however, succeed well in cold soil where the water is stagnant near the surface, and thorough drainage is very essential to a good crop.

Potatoes succeed admirably on new land providing it is well drained and not too stiff, as the soil is filled with decayed vegetable matter and humus which help to make it loose. Such soil retains moisture well, and furnishes nitrogen in a very available form. They succeed well after sod also, as the decaying sod gives somewhat the same conditions as new land. Clay and clay loams are not so suitable to the potato crop as the warmer sandy loams and gravelly soils as they are usually colder and being, as a rule, stiffer, the tubers are not as even in shape nor as smooth. The quality of the potatoes grown in sandy or gravelly soils is better than that of those grown in clay or clay loams.

Plant Food Requirements and Fertilizers.

Potatoes usually succeed well when grown after clover sod. In an experiment at the Central Experimental Farm, covering three years, there was an aevrage increase of thirty-seven bushels per acre of potatoes where clover had been sown with grain and ploughed under, over the plot where no clover was grown. Experiments have shown that the crop of grain is not lessened by sowing clover.

It will be readily seen that clover and barnyard manure are two very important and cheap fertilizers for the potato. The former obtains nitrogren from the air and brings up phosphoric acid and potash from great depths of the soil to be available for succeeding crops and in adding humus to the soil by its decay it makes the soil hold moisture better and renders it looser. Barnyard manure adds nitrogen, phosphoric acid and potash to the soil and increases the supply of humus in it, making the soil more retentive of moisture and looser.

From the information obtained from experiments at the Central Experimental Farm and elsewhere, the writer would recommend growing potatoes after clover which had been top dressed with from ten to twelve tons of barnyard manure per acre. If the clover is ploughed under in the autumn, green manure would be the best; if ploughed under in the spring, which is the better time, rotted manure is preferable, as it will become incorporated wtih the soil better than green manure and is not so likely to favor development of scab. The clover may be top dressed with green manure in late summer or autumn, even though the clover is not ploughed unled until spring, in which case the manure increases the crop of clover for turning under and is sufficiently broken up and worked into the surface of the soil to be in good condition for mixing with it when ploughed. Potatoes succeed well after corn which has been given a heavy application of barnyard manure. It is better to manure heavily for the preceding crop than for the potato crop itself.

Prepartaion of the Land.

The soil for potatoes should be well prepared before planting. Unlike some crops which succeed best when the soil is moderately firm when ready for seeding the potato succeeds best in soil which is loose. In loose soil the tubers will be smooth and shapely; in soil which is firm or stiff the potatoes are usually misshapen and not nearly so attractive. The ploughing under of barnyard manure and clover makes the soil looser and this, added to their value in furnishing plant food, makes them particularly desirable. Soils which are very light and loose may be made too loose by the turning under of manure, especially when it is green and strawy, and while it is not the best practice to plough under green manure immediately before planting, especially on light soils, if it is done the soil should be given extra tillage so as to incorporate the manure with it thoroughly and keep the first few inches of soil from drying out and preventing the satisfactory sprouting of the potato sets.

Spring ploughing for the potato crop is usually best. Where rather stiff soil has to be used, fall ploughing may be preferable as the action of the frost upon it will heup to loosen it. Good potato land should be ploughed in the spring, turning under the clover wtih its top dressing of manure. The soil should be ploughed deep enough so that the clover will be well covered. Different methods of preparation will be necesssary for different kinds of soil, but the nearer the land can be got into a thoroughly pulverized condition to a depth of about six inches or more before planting time the better the crop will be. When a planter is used the soil should be ploughed, thoroughly harrowed, and then rolled just before planting.

When rotted barnyard manure is used on land without clover it should be applied in the pring and thoroughly mixed with the soil. If it is well rotted it may be harrowed in. Neither rotted nor fresh manure should be put in the drill with the sets, as manure when it comes in contat with the tubers favors the deevlopment of scab. This was well proven in experiments at the Central Experimental Farm.

Planting Potatoes on Green Sod.

If the land has been ploughed the potatoes could be planted by opening holes for the sets about four or five inches deep and fourteen inches apart, making the rows 2½ feet apart, the manure having been spread over and harrowed in with the disc harrow. If the sod has not been ploughed one of the best methods of planting in green sod is to have some one planting when the ploughing is being done, the sets being dropped every third furrow and covered by the plough, when the next furrow is made. After the potatoes have been planted the ground is disc harrowed and if it is light soil it may be rolled after that to help close up any openings where grass could grow through and to compact the soil somewhat and hasten the rotting of the sod. This would not be desirable where the ground was heavy, as it would make it too firm. As soon as weeks start, harrow with the smoothing harrow and as soon as the potatoes are showing above the ground harrow again, then if thorough cultivation is followed afterwards and the tops protected from insects and disease, there should be a good crop.

Time of Planting.

The best time for planting potatoes will vary in different parts of Canada, much depending on the condition of the ground and spring frosts, but when these have not to be considered the earlier the potatoes are planted the larger the crop is likely to be. The sets should not lie long in the ground before sprouting, as there is danger of rotting, hence they should not be planted when the soil is cold and wet. If they are planted too early also the young vines are liable to get nipped by spring frosts. As early potatoes usually command good prices it is often worth taking the risk of frost and planting early if the soil is in good condition. If the vines should be above ground and there is danger of frost they may be covered slightly with the soil by tarning a shallow furrow over them. Potato growers have saved their vines by doing this.

Importance of Source and Vitality of Seed

In an experiment carried on at the Central Experimental Farm in 1917 with seed from Fredericton, N. B., Port Arthur, Ont., and Ottawa, the following yields were obtained: Total yield per acre, Fredericton seed, 341 bushels; Port Arthur seed, 400 bushels 24 pounds; Ottawa seed, 85 bushels 48 pounds.

The importance of seed from different sources has been confirmed by experiments conducted at the Agricultural College, Guelph, Ontario.

Just as marked differences were obtained in other years.

When to Change Seed

When a grower has found that it pays him to obtain seed of a certain variety from a certain source, he should endeavor by experiment and calculation to learn whether it will pay him to change his seed every year, every two years, or every three years.

The cause or causes of the very low yields at the Experimental Farm, Ottawa, during recent years from seed grown at Ottawa the previous year, are not yet clearly understood. The low yields began in the very dry seasons of 1906, 1907, and 1908, and there have been few good years for potatoes since, and, since that time, the diseases such as Leaf Roll, Mosaic and Rhizoctonia all have been found affectin gthe potato plants at Ottawa. How far these are the primary cause of the low yields and how much should be attributed to climate, is not yet certain, but the fact remains that by getting new seed every year from certain places, good yields can be obtained. While such marked results might not be obtained elsewhere, as at Ottawa, a change of seed is recommended where satisfactory yields are not being obtained. It has been the writer's observation that wherever potatoes grow vigorously, as a rule, until the tops are cut down by frost in the autumn, there will good seed potatoes be obtained, provided they are free from disease. Such sources of seed potaoes can be found in all the provinces of Canada and particularly in those parts of the provinces where the days and nights, during the growing season, are relatively cool, and where there is usually a good supply of moisture in the soil.

It has been shown by the experiments at Ottawa that the best results were obtained from the most immature seed, and while, doubtless, there is some other factor or factors than lmmaturity which ensure such good results from seed from the cooler parts of Canada, and which for the present may be called "vitality," it would seem, with out present knowledge, that the best seed will come from those parts of Canada where, as a rule, the main part of the crop is most immature, though of good marketable size, when the tops are cut down by autumn frosts, and where there is little or no disease in the crop.

Improvement by Hill Selection.

After a variety has been originated, and after its general characteristics have been sufficiently fixed to introduce it, ia variety may be changed, to some extent, by careful selection. This may be undertaken for the purpose of increasing the yield or to obtain a variety which is earlier or later, shallower in the eye, or of better shape. Selection may also be made to obtain a potato which is more resistant to disease and drought, better in quality, or with a higher percentage of starch, but while selection is desirable there needs to be more experimental evidence to show that marked, permanent changes in a variety can be made in this way.

The most accurate way to carry on hill selection is by the individual tuber or tuber-unit method by which the yield from each individual tuber is kept separate.

A simple method of selection, and one which will be found to give good results, is to dig enough of the general crop by hand each year so that enough seed can be selected from good hills to give a sufficient quantity of seed for the general crop. By this method the poor hills including potatoes of low vitality and those affected with disease are eliminated and the standard raised. This is perhaps the best method of selection for the average farmer.

While the methods of selection described are mainly for the purpose of increasing the yield, it is desirable to

(Continued on page 892)

Use of Insecticides and Fungicides

By A. J. Gunderson, Horticulturist

Every potato grower appreciates the importance of protecting his crops against the attacks of insects and fungous diseases. Every insecticide used on potatoes in the United States today is manufactured in a form ready for immediate use. The arsenic compounds are the principal insecticides used whereas nicotine compounds are used in lesser quantities. The only fungicide used on potatoes is bordeaux mixture. A great percentage of this material is home-made, altho there is a growing demand for prepared bordeaux mixtures.

The value of an insecticide depends upon its ability to kill or repel insects. In addition it must not injure the plants, should have good suspension qualities in the spray tank and should spread and adhere well on the foliage or fruit.

Potato crops are attacked by two classes of insects, chewing and sucking. The two most important chewing insects on potatoes are the Colorado potato beetle and the flea beetle. The sucking insects which cause the greater amount of damage are aphis and leaf-hoppers. Chewing insects actually eat the potato leaves and in consequence must be destroyed by means of an arsenical applied to the foliage. Sucking insects subsist upon the plant juices which are taken up thru their beaks. The destruction of these insects is accomplished by applying nicotine compounds directly to their bodies.

Arsenic Oxide Alone Produces Burns

Arsenic oxide constitutes the base of every arsenical spray used on potatoes to control chewing insetch. The use of this material alone would cause serious burning of the foliage and in addition it would be uneconomical because of its poor adhesive properties. In order that injury to plants may be avoided and that proper adhesiveness may be secured, arsenic oxide is combined with other materials to form such products as Paris Green, arsenate of lead, arsenate of calcium, arsenite of zinc and arsenate of soda.

Paris Green, a compound of arsenic and copper, is the leading insecticide used on potatoes. A good grade of Paris Green will kill potato "bugs" quickly due to its high arsenic content and should not injure the foliage because it contains a small percent of arsenic acid. Another important quality of a good Paris Green is fineness. Extreme fineness means good suspension in the spray tank and good atomization in dusting. Successful control of insects is dependent upon these conditions. As a general proposition it is safer and more economical to add slaked lime to Paris Green in spraying and to mix hydrated lime with it in dusting. In quick killing powers Paris Green is superior to any other arsenical spray. It is not, however, as adhesive as for example, arsenate of lead.

Spray at Hatching Season

The amount of Paris Green used to 50 gallons of water in potato spraying varies in different sections of the country. In some sections as little as one-half pounds to 50 gallons of water is used, while in others as much as three pounds are used. If spraying is done when potato "bugs" are newly hatched, less Paris Green will be required than if spraying is delayed until the "bugs" become half or full grown.

Arsenate of lead is a compound of arsenic and lead which is used most extensively on fruits, excepting citrus, and on vegetable crops in general. In a few potato sections arsenate of lead is the standard insecticide used against potato "bugs." For many years paste arsenate of lead was the only form manufactured. In recent years dry powdered arsenate of lead has practically displaced the paste form.

Paste arsenate of lead is also known as basic, neutral, or triplumbic arsenate of lead. It is a combination of one part of arsenic oxide and three parts of lead, containing about 15 per cent of arsenic oxide. Dry powdered arsenate of lead, also known as hydrogen, acid or diplumbic arsenate of lead is a combination of two parts of lead and one of arsenic oxide, containing about 33 per cent of arsenic oxide.

Paste or basic arsenate of lead forms a more stable compound between the arsenic and the lead than does dry powdered or hydrogen arsenate of lead. Basic arsenate of lead does not break down as rapidly after it has been applied as hydrogen arsenate of lead and therefore it does not kill potato "bugs" as quickly. Hydrogen arsenate of lead breaks down rapidly on the potato plant and therefore kills more quickly. For this reason dry powdered or hydrogen arsenate of lead is more desirable as a spray on potatoes than paste or basic arsenate of lead.

Both Powdered and Paste Arsenates Effective

Both powdered and paste arsenates of lead adhere well to the foliage and are effective over a long period. On potatoes dry powdered arsenate of lead should be used at the rate of from 2 to 2½ pounds to 50 gallons of water and paste arsenate of lead at just twice these amounts.

Arsenate of calcium is a comparatively new insecticide so far as its use on potatoes is concerned. It is a combination of arsenic and lime consisting of about 40 per cent of arsenic oxide. Arsenate of calcium has attracted considerable attention on account of its relative cheapness in comparison with other arsenical sprays and is well worthy of trial by potato growers. It should be used at the rate of from 2 to 2½ pounds to 50 gallons of water. In spraying it would be well to add slaked lime to the arsenate of calcium and in dusting mix with hydrated lime.

Arsenate of calcium will stay well in suspension in the spray tank and is so fine that even distribution is secured when it is applied as a dust.

Arsenite of zinc, a compound of arsenic and zinc is used to some extent in the northwest potato growing regions. It ranks next to Paris Green in killing efficiency and will not injure the foliage of potatoes. The bulk of arsenite of zinc used today is manufactured in dry powdered form, altho some paste is made. tI should be used at the rate of 2 pounds to 50 gallons of water with slaked lime or mixed with hydrated lime in dusting. Arsenite of zinc has good physical properties which insure good suspension in the spray tank and even and economical distribution in dusting.

Arsenate of soda is a compound of sodium and arsenic. This product is manufactured in dry powdered form and is used in considerable quantities in the state of Maine. Arsenate of soda contains a high percentage of total arsenic and arsenic acid. These qualities result in quick killing and necessitate the use of arsenate of soda in combination with lime or bordeaux mixture. Arsenate of soda is manufactured in dry powdered and "crystal meal" forms. The latter dissolves more easily in water than the former and offers greater possibilities. Arsenate of soda is applied only as a wet spray at the rate of about 2 pounds to 50 gallons of lime solution or bordeaux mixture. The quick killing properties of arsenate of soda is its only strong feature.

Nicotine Sulfate for Sucking Insects

In some seasons and sections aphis or plant lice and hoppers cause considerable injury to potato plants. The standard material to use against these sucking insects is nicotine sulfate. This should be used at the rate of ¾ of a pint and 2 pounds of soap to 50 gallons of water. It is essential that the spray be applied to the undersides of the plants in order to insure thorough application on the insects which must be killed by contact.

Practically every potato field must be sprayed with an insecticide of some kind during each season. In many regions early and late blight and tip burn cause considerable damage. In order to prevent blight and to check tip burn bordeaux mixture should be used. This material is made by the grower out of blue vitriol and slaked lime, and is also manufactured in paste and powdered form.

Of the two types of bordeaux mixture manufactured the powdered forms are the more desirable for the reason that they can be used in both spraying and dusting, do not deteriorate by drying out or freezing. The physical properties of dry bordeaux mixtures are good and they contain proper quantities of copper sulfate and the best grade of lime obtainable.

A great many potato growers do not use prepared bordeaux mixtures because they feel that the cost is too great. This is not true if consideration is made of the time and equipment required to make home-made bordeaux mixture and if the poor quality of the average lime available to the potato grower is considered. A good manufactured bordeaux mixture is made from the best grade of lime which is essential to good mixing, suspension, adhesiveness and control of diseases. The time element is one to be considered in spraying and in many seasons it will pay the potato grower to use a good prepared bordeaux mixture which will enable him to spray more promptly.

In purchasing insecticides and fungicides for use on potatoes every grower should discriminate between products of superior quality and those of poor quality. The good qualities are effective control, minimum amount of injury to the plants, good adhesiveness and spreading qualities. Any product that will insure these results is the most economical one to use on potatoes.

Delayed Application of Fertilizer

By Dr. H. J. Wheeler, Boston, Mass.

All of the fertilizer for potatoes in Aroostook County, Maine, is usually applied at the time of planting by means of the fertilizer attachment of the potato planter, provided the application does not exceed 1,500 pounds to the acre. Frequently, however, even as much as 2,000 pounds to the acre is applied in this way.

In Florida, on the contrary, the fertilizer is usually applied along the line of the row and covered by back furrows, or it is thoroughly worked into the soil where the rows are to be located, before planting is begun.

In many sections, a part of the fertilizer is set aside for application either just before or soon after the potatoes come up. In the latter case the plants should be dry when the application is made. If the potatoes are planted in drills, the second application is made on top of or beside the rows and it is then worked in with a light smoothing harrow, weeder, or other suitable implement which kills the yonng weeds over the whole surface and makes later cultivation and weeding easier. If the planting has been in check rows, late applications of fertilizer may be made around the hills just before the first or second cultivation. If necessary, all of the fertilizer may be applied in the same manner as the second application, although it is not the best plan.

This year in particular, on account of the delayed delivery of fertilizer caused by car shortage, dearth of labor, and freight embargoes, probably more fertilizer than ever will be used as a side or top-dressing for potatoes. In view of these conditions, it may be of special interest to see what resulted in Portage County, Wisconsin, from an application of fertilizer which was made around the hills just as the potatoes were coming up. n this particular case, no fertilizer was used at the time of planting. The fertilized area yielded 181 bushels to the acre and the unfertilized section yielded 112 bushels. Thus, the late application of fertilizer gave an increase of 69 bushels to the acre. Doubtless, a greater increase might have been secured had all or a part of the fertilizer been applied in a proper manner at the time of planting. The results show, nevertheless, how growers may recover profitably from an unfavorable situation when they have failed to fertilize at the time of planting or when they have not received their fertilizer until after the planting was finished.

We would like to receive for publication, some of the results of delayed application of fertilizer as experienced by New Brunswick Potato Growers this year.—Editor.

FEEDS WILL BE LOWER

The Maritime Farmer has received many enquiries from farm organizations as to the prices of feeds. Our advice has been to hold off buying as prices are dropping and will probably go lower. The wholesale prices quoted last week were flour, in wood, $15.00; in bags, $13.95; middlings, $59.90; bran, $54.90. We will be glad to buy mixed cars at these prices, subject to market quotations, for Maritime Farmer subscribers. They are rock bottom prices. In a short time we will have prices on Cotton Seed Meal, 36 per cent protein, and will be glad to quote you on car lots. There will be a higher freight rate than last year on all United States goods, and all prices will be quoted American funds, that is to say, buyers will have to pay the exchange on the face value of the draft. United States exchange dropped considerably a few days ago, but it is subject to market changes. We will also be glad to quote on oil cake in car lots. We will also be pleased to quote on Standard Stock feed, following the formula of the Live Stock Branch of the department of agriculturc, Ottawa. All feeds sold this fall must show their analysis on the bag. When you buy feed, be sure and see that you are getting full value for your money.

To ensure a good litter, the first requisite is to select a well-formed sow from a prolific family. This applies, whether she be a grade or a pure-bred. See that her teats are well placed and not less than twelve in number. Breed when about eight months old; thus, a sow from a spring litter will be ready to breed in the fall and nurse her first litter the following spring.

THE ST. JOHN EHIXBITION.

(Continued from page 867)

ston, of Newcastle, showed a couple of Hackeneys.

Beef Cattle.

The only represeutatives of the beef breed at the fair were a well fitted herd of Aberdeen Angus, shown by Horne Bros., of Winsloe Station, P.E.I.

Dairy Cattle.

Ayrshires, Holsteins, Jerseys and Brown Swiss were the only breeds of dairy cattle at the exhibition. The Ayrshire classes were well represented by the herds owned by McIntyre Bros., Sussex, N. B., A. McRae & Sous, Charlottetown, P. E. I., and Jas. K. Paisley, Beaver Brook, N. B. The McIntyre Bros.' Spring Brook Farm herd were out in good fettle aud carried off over twenty first prizes and a fair share of second and third prizes. To this herd went the Male Sweepstakes, on their imported Lou Milton McDonald, a junior yearling of exceptionally good quality and milk producing ancestry. This youngster was the junior champion. The senior champion was McRae's eight year old Capt. Kidd, by Howies Crusader, who snatched the coveted honor from Morton Main's Amanth, McIntyre Bros. aged herd header, now showing in his eleventh year, but who led the lists with three of his get. The female grand champion was McIutyre Bros.' Lass O'Gowrie, of Riverside, shown in the aged cow in milk class. The junior female championship went to their senior yearling imported Killoch White Rose.

Jas. K. Paisley with Baby of Landon, captured the red ribbon for best cow and two of her offspring. He also led the way with a senior yearling heifer. The Paisley herd is on a pretty good foundation and showed to much better advantage than they did a year ago at Fredericton. The McRae herd topped the list in a number of sections. Both the senior herd and junior herd first prizes went to McIntyre Bros.

The Holstein classes were ably represented by Harding Bros., Dickie Bros., and Frank Edwards. The battle royal waged between the first two mentioned herds, both of which were out in good shape. The Harding herd had just returned from the Province of Quebec, where they campaigned very successfully at Valleyfield, Sherbrooke and Three Rivers. The Dickie herd were fresh from their home pastures on Cobequid farm. Edwards is a new beginner with some good foundation stock.

The male sweepstakes went to Dickie Bros. on Prince Colanthus Canary B., shown in the aged bull class. This bull's three nearest female relatives have records of over 30 pounds butter each in seven days.

The female championship went to Harding Bros.' Faforit Poem, shown in the two year old class. This heifer was first in her class and female champion at all the Quebec fairs at which she was exhibited. The senior herd prize was captured by Dickie Bros., while the junior herd prize went to Harding Bros. Dickie Bros.' bull was first with three of hs get, and their Cobequid Mercer Fayne, a daughter of Mercena Artalissa, a former Amherst Winter Fair dairy test champion, led the way with two of her offspring. The first prize for best herd of 4 cows went to Dickie Bros., while the first prize for best herd of 4 calves went to Harding Bros. The graded herd class 1st prize also went to Harding Bros.

Jerseys were shown by J. R. Semple & Son, Truro, E. J. Young, Silver Falls, A. C. Josselyn, Silver Falls, and E de F. Holden & Son, Frelighsburg, Quebec. The lion's share went to the Quebec breeder in a well fitted herd of splendid individuals. The male champon iwas Holden's Brampton Oxford Rosebay, shown in the senior yearling class. Holden's aged cow Miss Parl H, was first in her class, female champion and first with two of her offspring.

Brown Swiss were shown by W. A. Jolley, Waterloo, Que., and Ralph H. Libby, Stanstead, Que. Both herds were well fitted aud creditably shown. They made a good impression at the Maritime fairs last fall and again this year they are maintaining their good records.

Sheep.

The sheep classes made a splendid showing, but Walter E. Allison was the only New Brunswick sheep breeder who exhibited. The balance of the showiug was made by Prince Edward Island, Ontario and Nova Scotia breeders. The sheep were for the most part in good fit. The silver cup for grand champion ram was won by a Shropshire ram shown by Geo. L. Boswell. Frenchfort, P. E. I.

Swine.

The swine display was small. A full list of awards will be found elsewhere in this issue.

The Judges.

The judges were:

Light Hroses—Dr. Ed. Watson, Toronto.

Heavy Horses—J. M. McCallum, Shakespeare, Ont.

Beef Cattle and Sheep—Duff Brien, Ridgeton. Ont.

Jerseys and Brown Swiss—G. D. Duncan, Todmorden, Ont.

Ayrshires—R. R. Ness, Howich, Quebec.

Holsteins—Neil Sangster, Ormston, Quebec.

Poultry—John Clark, Cainesville, Ontario.

Agricultural Products—S. J. Moore, Truro, N. S.

Horticulture—Geo. H. Vroom, Middleton, N. S.

On Thursday evening the directors of the Exhibition Assocaition entertained the live stock exhibitors at a banquet at which a sumptuous repast was served and at which the president of the Association, His Worship Mayor Schofield, announced the decision of the board to make the exhibition an annual event.

This announcement was received with hearty applause. A vote was taken to give the breeders a chance to show their approval of the new plan, the result of which was unanimously in favor of an annual exhibition at St. John.

Mr. Libby, one of the Quebec exhibitors, expressed the opinion that few if any exhibitions in Canada could boast this year as could St. John, of having live stock exhibits from five provinces, Ontario, Quebec, Nova Scotia, Prince Edward Island and New Brunswick being represented.

Several prominent breeders expressed their appreciation of the courtesy extended to them by the genial secretary, Mr. Horace A. Porter, and his staff, who were always ready to attend to their wants.

Next year's St. John fair will open September 3rd, the Saturday preceding Labor Day, and continue to September 10th. The prize list will be revised so that, as was so well said by the president, "tbe monies offered in prizes will be more commensurate with the present value of the dollar."

Excessive freight rates, scarcity of labor on the farm and an early season mitigated against the best showing of agricultural and other products as well as of live stock.

THE PRIZE WINNERS

DAIRY CATTLE

Ayrshires.

Bull, 3 years old and upwards—1, A. McRae & Sons, Charlottetown, P.E.I.; 2, McIntyre Bros., Sussex, N.B.

Bull, 2 years old—1, McIntyre Bros.

Bull, senior yearling—1, A. McRae & Sons; 2, J.K. Paisley, Beaver Brook, N. B.

Bull, junior yearling—1, McIntyre Bros.

Bull, senior calf—1 and 3, McIntyre Bros.; 2, A. McRae & Sons; 4, J. K. Paisley.

Bull, junior calf—1, McIntyre Bros.

Male Sweepstakes—1, McIntyre Bros.

Cow, 4 years old and upwards—1, 2 and 3, McIntyre Bros.

Dry Cow, 4 years old—1, 3 and 4, McIntyre Bros.; 2, A. McRae & Sons.

Cow, 3 years old—1 and 3, A. McRae & Sons; 2, McIntyre Bros.

Dry Cow, 3 years old—1 and 2, McIntyre Bros.; 3, A. McRae & Sons.

Canadian Cow, 3 years old—1, 3 and 4, McIntyre Bros.; 2, A. McRae & Sons.

Heifer, 2 years old—1 and 3, McIntyre Bros.; 2 and 4, A. McRae & Sons.

Heifer, senior yearling—1 and 2, McIntyre Bros.; 3, A. McRae & Sons; 4, J. K. Paisley.

Heifer, junior yearling—1, J. K. Paisley; 2 and 4, Mclutyre Bros.; 3, A. McRae & Sons.

Heifer, junior calf—1 and 2, McIntyre Bros; 3, A. McRae & Sons; 4, J. K. Paisley.

Female Sweepstakes—1, McIntyre Bros.

Senior Herd—1 and 3, McIntyre Bros.; 2, A. McRae & Sons.

Breeders Young Herd—1, McIntyre Bros.; 2, A. McRae & Sons; 3, J. K. Paisley.

Bull and 3 of his get—1, McIntyre Bros.; 2, A. McRae & Sons.

Cow and 2 of her offspring—1, J. K. Paisley; 2 and 4, McIntyre Bros.; 3, A. McRae & Sons.

Special.

Senior Champion Male—1, A. McRae & Sons.

Senior Champion Female—1, McIntyre Bros.

Junior Champion Male—1, McIntyre Bros.

Junior Champion Female—1, McIntyre Bros.

Four Animals, get of one sire, either sex, any age, bred and owned by exhibitor—1, 2 and 4—McIntyre Bros.; 3, J. K. Paisley.

Two Animals, progeny of one cow, either sex, any age, bred and owned by exhibitor—1 and 4, McIntyre Bros.; 2, J. K. Paisley; 3, A. McRae & Sons.

Silver Cup donated by Canadian Drug Co., Ltd., St. John, N. B., for best herd of Ayrshires, consisting of one bull, 2 years and upwards, 4 females, 2 years and upwards, and4 females under 2 years—1, McIntyre Bros.

Silver Cup donated by the Brayley Drug Co., Ltd., St. John, for six best pure bred dairy animals, any breed, 24 months or under, 5 females and 1 male, fitetd on Dr. Wilson's Dairy Condition Powder—1, McIntyre Bros.

Aberdeen Angus.

The first prize in every section of the Aberdeen Angus class went to Horne Bros., Winsloe Station, P.E.I., without competition, as wel las second and third prizes in the sections where they had entries.

Brown Swiss.

Bull, 3 years old and upwards—1 and 2, W. A. Jolley, Waterloo, Que.; 3, Ralph H. Libby, Stanstead, Que.

Bull, 2 years old—1, W. A. Jolley; 2, Ralph H. Libby.

Bull, junior yearling—1, Ralph H. Libby; 2, W. A. Jolley.

Bull, senior calf—1, W. A. Jolley; 2, Ralph H. Libbey.

Bull, junior calf—1 and 3, W. A. Jolley; 2 and 4, Ralph H. Libbey.

Male Sweepstakes—1, W. A. Jolley.

Cow, 4 years old and upwards—1 and 4, W. A. Jolley; 2 and 3, Ralph H. Libbey.

Dry Cow, 4 years old—1, W. A. Jolley.

Cow, 3 years old—1, W. A. Jolley; 2, Ralph H. Libbey.

Dry Cow, 3 years old—1, W. A. Jolley.

Canadian Cow, 3 years old—1, W. A. Jolley; 2, Ralph H. Libbey.

Heifer, 2 years old—1 and 3, W. A. Jolley; 2 and 4, Ralph H. Libbey.

Heifer, junior yearling—1 and 4, Ralph H. Libbey; 2 and 4, W. A. Jolley.

Heifer, senior calf—1 and 3, W. A. Jolley; 2, Ralph H. Libbey.

Heifer, junior calf—1, Ralph H. Libbey; 2, W. A. Jolley.

Female Sweepstakes—1, W. A. Jolley.

Senior Herd—1, W. A. Jolley; 2, Ralph H. Libbey.

Breeders Young Herd—1, W. A. Jolley; 2, Ralph H. Libbey.

Bull and three of his get—1, W. A. Jolley; 2, Ralph H. Libbey.

Cow and 2 of her offspring—1, W. A. Jolley; 2, Ralph H. Libbey.

Jerseys.

Bull, 3 years old and upwards—1, E. de F. Holden & Son, Frelighsburg, Que.; 2, J. R. Semple & Son, Truro.

Bull, 2 years old—1, E. J. Young, Silver Falls, N. B.

Bull, senior yearling—1, E. de F. Holden & Son.

Bull, junior yearling—1, E. de F. Holden & Son; 2, J. R. Semple & Son.

Bull, senior calf—1 and 4, E. de F. Holden & Son; 2, J. R. Semple & Son. 3, A. C. Josselyn, Silver Falls, N. B.

Bull, junior calf—1 and 3, E. de F. Holden; 2, E. J. Young.

Male Sweepstakes—1, E. de F. Holden & Son.

Cow, 4 years old—1 and 2, E. de F. Holden & Son; 3, A. C. Josselyn; 4, E. J. Young.

Dry Cow, 4 years old—1, A. C. Josselyn; 2, E de F. Holden & Son; 3, J. R. Semple & Son.

Cow, 3 years old—1, E. de F. Holden & Son; 2, E. J. Young; 3, J. R. Semple & Son.

Dry Cow, 3 years old—1, E. de F. Hodlen & Son; 2, J. R. Semple & Son.

Canadian Cow, 3 years old—1 and 2, E de F. Holden & Son; 3, A. C. Josselyn; 4, J. R. Semple & Son.

Cow, 2 years old—1 and 2, E. de F. Holden & Son; 3, E. J. Young; 4, J. R. Semple & Son.

Heifer, 2 years old—1, E. de. F. Holden; 2, A. C. Josselyn.

Heifer, senior yearling—1, J. R. Semple & Son; 2, E. J. Young; 3, E. de F. Holden & Son; 4, A. C. Josselyn.

Heifer, junior yearling—1, E. de F. Holden & Son; 2 and 3, A. C. Josselyn.

Heifer, senior calf—1, J. R. Semple & Son; 2 and 4, E. de F. Holden & Son; 3, A. C. Joselyn.

Heifer, junior calf—1 and 4, E. de F. Holden & Son; 2, J. R. Semple & Son; 3, E. J. Young.

Female Swepstakes—1, E. de F. Holden & Son.

Senior Herd—1, E. de F. Holden & Son; 2, E. J. oYung; 3, J. R. Semple & Son.

Breeders Young Herd—1, E. de F. Holden & Son; 2, J. R. Semple & Son; 3, A. C. Josselyn.

Bull and 3 of his get—1, E. de F. Holden & Sons; 2, E. J. Young.

Cow and 2 of her offspring—1, E. de F. Holden & Sons; 2 and 4, J. R. Semple & Son; 3, A. C. Josslyn.

Holsteins.

Bull, 3 years old—1, Dickie Bros., Truro, N. S.; 2, Harding Bros, Welsford, N. B.

Bull, 2 years old—1, Harding Bros.

Bull, senior yearling—1, F. Edwards, Lower Millstream, N. B.

Bull, junior yearling—1, Dickie Bros.; 2, Harding Bros.

Bull, senior calf—1, Harding Bros.; 2, F. Edwards; 3, Dickie Bros.

Bull, junior calf—1 and 3, Harding Bros.; 2, F. Edwards.

Male Sweepstakes—1, Dickie Bros.;

Cow, 4 years old—1, Dickie Bros.; 2 and 3, Harding Bros.

Dry Cow, 4 years old—1 and 2, Dickie Bros.; 3, F. Edwards.

Cow, 3 years old—1, Dickie Bros.; 2, Harding Bros.

Dry Cow, 3 years old—1, Harding Bros.; 2, Dickie Bros.; 3, F. Edwards.

Canadian Cow, 3 years old—1, Dickie Bros.

Cow, 2 years old—1, Harding Bros.; 2, Frank Edwards.

Heifer, 2 years old—1, Harding Bros.; 2, Dickie Bros.

Heifer, senior yearling—1 and 2, Harding Bros.; 3, Dickie Bros.

Heifer, junior yearling—1 and 4, Harding Bros; 2 and 3, Dickie Bros.

Heifer, senior calf—1 and 4, Harding Bros.; 2, F. Edwards; 3, Dickie Bros.

Heifer, junior calf—1 and 3, Harding Bros.; 2, Dickie Bros.

Female Sweepstakes—1, Harding Bros.

Senior Herd—1, Dickie Bros; 2, Harding Bros.; 3, Frank Edwards.

Breeders Young Herd—1 and 3, Harding Bros.; 2, Dickie Bros.

Bull and 3 of his get—1, Dickie Bros.; 2, Harding Bros.

Cow and 2 of her offspring—1, Dickie Bros.; 2, Harding Bros.

Herd consisting of four cows, any age—1, Dickie Bros.; 2, Harding Bros.

Herd consisting of four calves under 1 year, bred by exhibitor—1, Harding Bros.; 2, Dickie Bros.

Herd consisting of one cow, 3 years old, one 2 year old heifer, 1 yearling heifer, 1 heifer calf, and 1 bull calf, all bred and owned by exhibitor—1, Harding Bros.; 2, Dickie Bros.

SHEEP.

Grand Champion Ram. any breed, 2 shears and over—Silver cup donated by the Canadian Bank of Commerce, St. John, N. B.—Geo. L. Boswall, French Fort, P. E. I.

Cotswolds.

All first and several second and third prizes in the Cotswold class won by Almon Boswall, Dunstaffrage, P. E. I. ,without competition.

Leicesters.

Ram, 2 shears and over—1, S. C. Stewart & Son, Dunstaffrage, P.E.I.; 2, S. L. Boswall, Pownal, P. E. I.

Shearing Ram—1 and 2, S. L. Boswall; 3, S. C. Stewart & Son.

Ram Lamb—1 and 2, S. C. Stewart & Son; 3, S. L. Boswall.

Ewe, 2 shears and over—1, 2 and 3, S. L. Boswall.

Shearing Ewe—1 and 3, S. C. Stewart & Son; 2, S. L. Boswall.

Ewe Lamb—1 and 2, S. C. Stewart & Son; 3, S. L. Boswall.

Pen, Ram and 4 Ewes—1, S. L. Boswall; 2 and 3, S. C. Stewart & Son.

Pen Lambs—1, S. C. Stewart & Son; 2, S. L. Boswall.

Loncolns.

All first prizes and several second and third prizes in the Lincoln class were won by Albert Boswall, French Fort, P.E.I., without competition.

Shropshires.

Ram, 2 shears and over—1 and 3, Geo. L. Boswall; 2, Walter E. Allison, Rothesay, N. B.

Shearing Ram—1 and 2, Geo. L. Boswall.

Ram Lamp—1 and 3, Geo. L. Boswall; 2, J. R. Semple & Son, Truro.

Ewe, 2 shears and over—1, Geo. L. Boswall; 2 and 3, Walter E. Allison.

Shearing Ewe—1 and 2, Geo. L. Boswall.

Ewe Lamb—1 and 2, Geo. L. Boswall; 3, Walter E. Allison.

Aged Pen—1 and 3, Geo. L. Boswall; 2, W. E. Allison.

Young Pen—1, Geo. L. Boswall; 2, W. E. Allison; 3, J. R. Semple & Son.

Southdowns.

Ram, 2 shears and over—1 aud 2, A. Ayer, Hampton, Ont.; 3, J. R. Semple & Son.

Shearing Ram—1 and 2, A. Ayre; 3, J. R. Semple & Son.

Ram Lamb—1 and 3, A Ayer; 2, J. R. Semple & Son.

Ewe, 2 shears and over—1 and 3, A, Ayre; 2, Cephas Nunn, Winsloe Station, P.E.I.

Shearing Ewe—1 and 2, A. Ayre; 3, J. R. Semple & Son.

Ewe Lamb—1 and 3, A. Ayre; 2, J. R. Semple & Son.

Aged Pen—1, A. Ayre; 2, J. R. Semple; 3, Pephas Nunn.

Pen Lambs—1, A. Ayre; 2, J. R. Semple & Son; 3, Sephas Nunn.

Dorsets.

All first prizes and several second and third prizes in the Dorset class were won by Geo. L. Boswall, without competition.

Hampshires.

Ram, 2 shears and over—1, A. Ayre; 2, and 3, Cephas Nunn.

Shearing Ram—1 and 3, Cephas Nunn; 2, Lorne Nunn, Winsloe Station, P.E.I.

Ram Lamb—1, Cephas Nunn; 2, Lorne Nunn; 3, J. R. Semple & Son.

Ewe, 2 shears and over—1, A. Ayre; 2, Cephas Nhnn; 3, L. Nunn.

Shearing Ewe—1 and 2, Cephas Nunn; 3 A. Ayre.

Ewe Lamb—1, Cephas Nunn; 2 and 3, A. Ayre.

Aged Pen—1, Cephas Nunn; 1, A. Ayre; 3, Lorne Nunn.

Pen Lambs—1, Cejhas Nunn; 2, A. Ayre; 3, Lorne Nunn.

Cheviots.

Wih the exception of third prize on aged ram which went to Cephas Nunn and second prize on yearling ram which went to Albert Boswall, all the prizes in the Cheviot class went to Cephas Nunn.

Suffolks.

Ram, 2 shears and over—1, A. Ayre; 2, J. Reagh Horne, Winsloe Station, P. E. I.

Shearing Ram—1, A. Ayre; 2, A. Parker Horne, Winsloe Station, P.E.I.

Ram Lamb—1 and 2, A. Ayre; 3, A. Parker Horne.

Ewe, 2 shears and over—1, A. Ayre; 2, A. Parker Horne; 3, J. Reagh Horne.

Shearing Ewe—1 and 2, A. Ayre; 3, A. Parker Horne.

Ewe Lamb—1, 2 and 3, A. Ayre.

(Continued from page 890)

Notes From the Nova Scotia Agricultural College

PRIZE ESSAY ON THE COW.

A few years ago a series of lessons on dairying was prepared and placed in the hands of the Rural Science teachers in the province of Nova Scotia, for use in the schools. Under the direction of Mr. H. R. Brown, Promoter of the Dairy Industry, prizes were offered for essays on the basis of this instruction. The first series of prizes were for competition in each school section. The best essay from each section then went in to compete for a county or district prize. The best from each of these, in turn, were sent up for a grandl provincial prize, donated by the Dairymen's Association of Nova Scotia. It has been secured this year by Allison Fraser, age 12 years, in the Green Hill school, Pictou County. It is published below.

The Dairymen's Association also offered a prize to the teacher whose pupils made the highest average in dairy subjects. The latter prize has been awarded to Miss Alice Gray, teacher in the Green Hill school.

The Cow and Her Products.

There are two types of cows, the dairy type and the beef type. The principal dairy breeds are the Jersey and Guernsey, Ayrshire and Holstein. The principal beef breeds in Canada are the Shorthorn and the Hereford. The Jersey came from one of the Channel Isles called Jersey. The Jersey is noted for her beauty, gentleness and quality of milk. She varies in color from dark brown to silver grey and different shades of fawn. The Guernsey is a stronger and larger cow than the Jersey and her milk is very much more yellow than any other breed of cows. She is either brown or yellowish with white spots or reddish. The Jersey and the Guernsey are the best dairy breeds, their milk is 5 per cent. butterfat.

The Holstein is a type of cow that came from Holland, where there are rich meadows, and will not live on poor pastures as well as some breeds. She is a large cow, black and white in color. She gives the most milk of any breed but not so rich. The Ayrshire came from Ayr in Scotland and is a very good cow on poor pastures. She came to Montreal years ago on Scottish ships to supply milk to the passengers. The milk of the Ayrshire and Holstein contains only 3.6 per cent. butterfat.

The food cows need to keep their body in repair is called maintenance ration and the portion that is over goes into making milk. A cow has to gave good food before they can provide milk and must get it in a form which they like. The natural food for cows is green grass and after the pasture gets dry you should give them something to take the place of green grass. Ensilage is good. It is a green feed that is cut up and put in an air tight box or bin and it will sour and is good for the cows in winter. You can feed white or yellow turnips, tops and all, in the fall. The cows should get plenty good pure water. They also need 600 to 800 square feet of air space in the stable. There should be ventilators in the stable to let the fresh air in and the bad air out. The sunshine is the best thing to kill germs and cows should have lots of sunshine. There should be 5 to 7 square feet of glass to each cow. The stable should be kept clean. You should milk in a bucket all covered over but one little hole in the top to keep the dust of the cows body from falling in the milk. The milk should be strained through 2 or 3 ply of cheesecloth and all buckets and separators should be washed and scalded after using. The cow should be thoroughly brushed but not before milking because the dust will go in the milk. Their udder should be wiped with a damp cloth before milking.

Milk is a clear liquod with a great many tiny round balls in it called globules. The globules in the milk is what gives the color to it. In 100 pounds of milk there are 87 pounds of water, 4 pounds of butterfat, 4 1-3 pounds of milk sugar, 3 pounds of casien, 2-5 pounds albumen, 3-4 pouuds of ash. The little globules in the milk are fat and form butter when you churn the milk. The Jersey cow makes more butter than any other cow. Milk is the best food you can get because it contains all the food the body needs and in the right proportion. The water in the milk when distilled looks like pure water but there is a taste and a small to it, which belongs only to mlik. The globules in the milk average a size of about 1-6000 of an inch and the Jresey cow has the largest globules. The sugar in milk is what causes it to sour and when taken out it is a sort of a powder not very sweet and is used by doctors to mix with pure drugs. The casein and albumen are what makes the disagreeable smell when milk spoils. It is this that causes the milk to thicken when rennet is adde dnad so we are able to mke curds and different kinds of cheese. The ash in milk consists of potash, lime, soda, magnesia, and iron and is useful for making bone and muscle.

ALERTNESS.

These are days of agitation, discussion and controversy. Farmer's parties organize on the plea that they are not properly represented and their rights sufficiently conserved. Whatever the truth or untruth of this claim, it is natural to ask why they have this impression. One answer is at least suggested by recent developments in the dairy industry.

Co-operative Creameries have been established within the past few years in most sections of the province of Nova Scotia. These are owned and controlled entirely by the farmers themselves. Their greatest difficulty has always been to get enough competent men to take sufficient interest to make the business a success. Where they have made a real success the responsibility has fallen upon a few men who were determined to see the matter through. The success attained by these is so obviously important and worth while in every way that one need not dwell upon it. Our contention just here is that we have here a splendid line of work, which, where successful, has built up the community and returned good dividends, and this industry, entirely owned and controlled by farmers, has had the greatest difficulty in securing and maintaining their interest.

Now for another point. While, up to the present, dairy development has been fairly satisfactory in the districts served by creameries, it is quite evident that a greater interest must be taken in their own business by farmers themselves or a number of these companies cannot be a permanent success. It is also quite evident that, where it has been made a success, unless the milk producer is alert to the situation, the ownership and control of the business will gradually slip away from him, as it has already done in other provinces where dairying was established earlier.

In the Province of Ontario, dairying was deevloped through the medium of the local creamery and cheese factory, co-operatively organized. As milk production increased and the business became larger, a certain amount of dissension arose between the producers and they began pulling apart. Business men saw their opportunity and got control, with the result that today the control of the dairy business is largely in the hands of private enterprise, such as Milk Condensers, Centralized Creameries, privately owned cheese factories, privately owned city milk dsitributing plants, etc. The same situation prevails to a greater or less extent in the district surrounding Truro, where the dairy business was at first developed through the cheese factory. Here also disagreements arose among milk producers, and the result was a milk condenser, privately owned and operated.

For a number of years past different large concerns have had their agents watching over the creamery territories in the hope of starting some privately owned concern. This article is not intended to provoke any discussion as to which would be the more profitable to the milk producers, but to point out that, while, as yet, control is in the hands of the producer, unless he is on the alert and really interests himself in keeping it, it will surely slip out of his hands. So, while he seeks his rights by other methods, here is a large farming interest wherein the farmer is supreme, and he is in danger of letting it out of his hands through apathy.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.
Contract rates on application.

R. D. Robinson Publishing Co., Limited
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

SEPTEMBER 14

THE FARMER AS AN ADVENTURER

Very little literary talent has ever been spent on tales about the life of the man with a hoe or pitchfork, but irrespective of all this the life of the farmer is essentially the life of adventure. The dictionary meaning of the word adventure is "a bold undertaking in which hazards are to be met and the issue hangs upon unforeseen events." What could better describe the work of farming?

Boldly the farmer sows and plants the fields he has made mellow with plow and disk. But what shall the harvest be, or indeed shall any crop at all be gathered? He cannot tell. The outcome of all his labor depends upon incalculable events. The farmer not only faces the risks of business when he comes to marketing his crops, he confronts the elemental hazards of nature in their production. The planted corn may rot; cut worms may work havoc in his fields; a new blight or bug may visit the potatoes; a long drought may make the pastures look like a dessert; wind and hail may lay low the most promising field of grain, and the autumn rains may start the wheat in the shock to growing.

Like every man who lives an adventurous life, if the farmer is to succeed he must have three characteristics, and the first of these is faith. He must believe that an abundant harvest will follow a generous sowing. An old proverb has it that "He that observeth the wind shall not sow; he that regardeth the clouds shall not reap;" but the farmer, facing squarely the possibilities of failure and loss, must hold fast the conviction that on the whole Nature's forces are on the side of the wise and industrious tiller of the soil, and go ahead.

But to take great risks in faith requires courage. The farmer must have the soldier spirit. It is not enough to believe he can succeed; he must put faith to the test. Nature may have a most forbidding look, but pluckily he must go over the top.

The result of his courageous venture will not be apparent all at once. There is a long time between spring and fall. Months must go by before the farmer knows the real success or failure of many a daring leap in the dark. Meanwhile he must display the fine virtue, so much extolled in the recent war—he must "carry on."

THE CONSERVATION OF FERTILITY

Farmers should save every pound of manure, liquid and solid. In intrinsic and market value barnyard manure is considerably higher than it was a few years ago, and is invaluable on the farm where it is produced. Sources of the three great essential plant foods, nitrogen, potash and phosphoric acid, whether as feed or straight fertilizers, are expensive. The price of acid phosphate is almost prohibitive, owing to various causes. Farmers who breed and feed live stock using as much as possible home-grown feeds are relatively more favorably situated than heretofore for obtaining their sources of plant food, compared with the exclusive grain-farmers. Notwithstanding the present high prices obtained for grains, the growers are finding the apparent advantage offset if they mean to replace those essential elements of the soil which they ship from the farm with each crop. The most up-to-date farmers have an underground tank or cistern connected with their cattle barn and stable drains. Sixty percent of the fertilizing ingredients of the feed eaten is contained in the liquid portion of the manure, and those farmers who have no cistern to collect it should see to it more than ever before that sufficient straw or other absorbent is used for bedding. The fertility of farms where live stock enters largely into the operations can be distinguished at a glance in most districts from the apparent fertility of the land, and under present conditions this comparative advantage over the grain-grower is bound to be more marked. Clovers, alfalfa, peanuts, soy, velvet and other beans, according to the state of climate, along with good live stock, are the things to enrich and preserve the fertility of farms.

WASTE OF WOMAN POWER

The necessity of modernizing the farm home cannot be overestimated. It is the tendency and almost the universal practice for the farmer to purchase all modern machinery for operating his farm and equipping his barn with every device for saving labor before any attention is given to the purchase of home conveniences for his wife and family. There is a reason for this because improved machinery and better equipment for the barn makes it possible for the farmer to secure a larger return but we believe it is carried too far.

We have had opportunity of late to observe farms well equipped in every respect for field and farm work but the houses had no modern conveniences and yet the farmers were adequately able to purchase them.

The farmer often complains about his long hours in close confinement, but we believe on the average the woman's work on the farm is more confining and the hours longer than that of the farmer. We should not look upon the farm as merely a place to make money, but rather a place to build a home and a life. This cannot be accomplished until the woman's work is considered of as much importance, if not more, than the man's and when this point of view is taken, it will be observed that the conveniences of the household are quite as important as modern machinery and improved methods of doing work in the barns and fields.

DON'T TAKE A CHANCE WITH FIRE

"It never pays to take a chance with fire," says a circular issued by the Forest Service, United States Department of Agriculture, in its campaign against forest fires. "If you have got to gamble take a 'flyer' on the stock market or play the ponies, but don't take a chance on fire."

"Every thousand feet of green timber near your home is worth at least $10 in wages to you and your neighbors, besides its stumpage value to its owner. If it is on national forest land, you are part owner, and if it is destroyed by fire, you lose both values.

"Burned timber pays no wages," the circular says. "The prosperity and development of your locality is going to depend upon keeping that timber green.

"Don't take a chance with fire yourself, and don't let your neighbor do it. When you burn brush take every precaution to obey the law and see that your neighbor does. Remember that your home and his can go up in smoke from one piece of carelessness.

"The biggest fires in history were started by those who didn't think the woods would burn. Be as careful of fire as you are of powder; it's just as dangerous."

GIVE THE FARM A NAME

In the past farmers have been too busy or perhaps a bit too careless to give names to their homes. It is not that they are less busy now, but they possess a new dignity. Farmers to-day are conscious that they are free men and walk the earth with a little firmer tread because of what they have been able to do in the past few years.

Would it not be well to round this out by making the home and farm as near a real home as possible? There is no place in the world where men and women and children can live such sane normal lives as under ideal farm conditions. It is difficult to attain the ideal but it is worth striving for.

It is not a very difficult matter to give a suitable name for your farm. No matter how humble or isolated it may be it is your home and as such deserves a name. It is nicer to be able to say, The Oaks or The Maples, than Jones' or Smith's place. Such names as The Maples, Maple Hill, Elm Ridge, The Grove, Hickory Ridge, Valley Farm, The Knoll, etc., are but suggestions. Let the women and girls name the place and we may be sure that the selection will be most appropriate. What is home without a name?

* * *

It is well to advise the consumer regarding the food value of milk and its products, but it is also wise that a higher quality of dairy products be produced. Complaint comes from every source of the poor quality of butter, of its high moisture, of improperly made and cured cheese, and of the low standards of ice cream. There is not one of these products that could not be materially increased without any effort, so far as advertising is concerned, by simply producing a more uniform and higher quality of all dairy products.

Since milk has been pasteurized and bottled there has been a decided increase in consumption, for along with the pasteurization and bottling came the campaign for the production of a higher grade of milk. The man on the farm who produces the milk may feel that he has little to do with increasing the consumption of his product, but if he were fully advised regarding how much more dairy products the consumer will eat when they meet his personal taste, when they are of good quality, he would view his position with more concern. A butter that will score from 92 to 95 will be consumed in much larger quantities than butter scoring from 85 to 90. The same applies to cheese, milk, and ice cream.

BONUSING CLOVER HULLERS IN NEW BRUNSWICK.

E. P. BRADT, Secretary for Agriculture.

A few years ago the New Brunswick Department of Agriculture purchased a clover huller to be used for demonstration purposes in the province. This was the first huller introduced and has been the means of demonstrating that an excellent yield of high quality seed can be produced in the province. About 125,000 pounds of excellent clover seed was threshed by this outfit in the season just passed. Previous to this pratcically all the clover seed used was imported. The great bulk of the seed is still imported. Our own supplies should by all means be grown within the province. The Department of Agriculture is taking steps to bring about this result.

The lime policy recently adopted by the Department and which now makes it possible for farmers in any part of the province to get lime tested 94 per cent carbonate delivered to them freight prepaid at $5.00 per ton, is expected to make the growing of clover much more successful and also much more general throughout the province.

With the growing of the clover crop becoming more general and easy of attainment through the use of lime special attention will be given by the Department to the promotion of the growing of clover seed. The government owned huller can only do a limited amount of the necessary threshing in the province and it has been deemed advisable to encourage the purchase of hullers in the various counties of the province. The plan is to group the societies in the various counties and encourage the co-operative purchase of hullers through the Agricultural Societies by means of offering to bonus such outfits as may be approved.

Application from Societies in three counties have already been received and many more are expected to avail themselves of this opportunity. Threshing faiilities will thus be placed within reach of the farmers in every part of the province and clover seed growing will receive a decided impetus thereby.

The following regulations will govern the granting of the bonus by the Department of Agriculture:

1. Agricultural Societies desirous of securing a bonus on a clover huller should make application to the Department of Agriculture. Fredericton. The location of the outfit will be considered and if approved as being so located as to meet the neens of that particular county, approval will be given, and the Society notified that upon the purchase of a satisfactory outfit a bonus will be granted.

2. After the arrival of the huller. an inspector from the Department will insppect the outfit and if satisfactory will recommend a bonus.

3. Not more than two hullers will be bonused in any one county. These must be so situated as to providie threshing facilities for the county.

4. Societies must supply the original invoice from the firm from whom the purchase was made when making application for a bonus from the Department.

5. Societies may and are encouraged to use their regular government grants or any donations received, for the purpose of providing funds to purchase a clover huller.

6. The Department bonus will be 25 per cent. of the purchase price of the outfit as approved. The maximum bonus in any case not to exceed $500.

THE WOOL MARKET.

The wool market is still very properly termed "listless" with occasional bright spots howing on the surface. As reported in our last letter, our sales during recent weeks have totalled something better than 1½ million pounds. Of this amount 300,000 pounds was sold to one mill. It consisted of eastern domestic medium staple and low medium staple at 52 and 42 cents repectively f.o.b shipping points. This figures out to approximately 90 and 70 cents on a clean basis.

The majority of Canadian mills are now working on a large Roumanian contract that will keep them busy for some time to come and doubtless a large proportion of the 500,000 lbs. sold by us to Canadian mills so far this season has been placed on the strength of this Roumanian order. Many American mills including those operated by the American Woolen Company are still closed with the possibility of some of them re-opening after Labor Day.

There is still very little action on the part of dealers in the country and there is no doubt that a good deal of wool is being held locally by farmers. Up to date 150 carloads are reported as having been delivered at Weston or en route to that point from Western Canada. It would seem that there is an endless quantity of wool being held in storage on this continent. This is borne out by the following statement made recently by the Ohio Wool Growers' Association: "Our association has about one million pounds new wool stored in our Columbus warehouse. We have about the same amount at Wheeling and there is four times both stored in good places on the farms of Ohio, by growers, and we cannot sell a pound at any price. It is practically worthless, the only commodity on earth without a market."

Our stockmen's supply business so far this esason shows a marked increase over the previous year. Sales for the first seven months of 1920 total $18,856.99, as compared with $14,190.84 for 12 months ending December 31st last.

Canadian Co-operative Wool Growers, Limited.

EXHIBITING GRAINS AND GARDEN PRODUCTS.

It is not difficult to make a good sample of grain for show. All you need is grain that is good quality to start with and then a little dressing up will fit it nicely for the show. The rules of the show tell how much grain shall be in a show sample. Quality is the one thing to look out for. Plump kernels of good quality and color, clean and free from weed seed, other kinds of grain, chaff, and dirt are the things to look out for. The first thing to do in preparing a sample of grain then is to see that you have good plump grain. The second thing to do is to clean it up thoroughly so that there is nothing present but the grain itself. You cannot be too careful about this. The judge will not stand for weed seeds in a show sample, nor does he like to see chaff and dirt and pieces of sticks present. It might be a good plan after you have cleaned it up as thoroughly as possible to spread the peck of grain out on the table or on a clean floor and look it over carefully so that you can remove any weed seeds which have not been taken out withr a fannnig mill.

But this is only a part of dressing up the sample. The container in which you exhibit will either add to or detract from the appearance of the sample. Grain samples are best exhibited in nice, clean, white sacks, grain pans, or neat boxes. In exhibits of any kind neatness should always be one of our mottos.

Perhaps you have planned on exhibiting some grain in the sheaf. That is a mighty fine idea because sheaf samples of grain when properly put up are very pretty to look at. Most shows nowadays offer prizes on sheaf samples. There are just a few things to know in order to make a good looking sheaf sample ol grain. The straw should be left full size and should be stripped clean of the leaves and the heads should be arranged in an attrartive way. This does not mean that they should be arranged in any peculiar design. A sheaf sample which is about six inches in diameter just beneath the head is large enough. Some people make a mistake by making the samples look too clumsy. Then there is another important point and that is the way the sheaf sample is tied. Binder twine and white cord should not be used. It is best to use narrow ribbon, either red or yellow in color, or narrow tape of these colors will do. The sample should be tied just as many times as is necessary to make it firm. Usually three or four time .is enough—once beneath the heads, once or twice near the middle and again near the butt. The ties should be tight and there should be no ends left on the ribbon or tape. Consequently it is best to tie in a hard knot instead of a bow and cut off the ends of the ribbon.

When a judge awards the prizes and ribbons to sheaf samples he does so upon these points. Quality grain, attractiveness of the sheaf, and the color of the straw.

Many who have nothing else to exhibit can usually find something in the home garden that would be worth while preparing and, because so many of us are interested in gardens, this class in the show should be well filled. An attractive vegetable display is intersting to everybody and there are some things to know in order to make a garden product exhibit look its best.

First of all, no matter what the exhibit is, quality must never be sacrificed for quantity. Over-sized, coarse vegetables may be interesting to look at but it is seldom a judge awards the prize for size and coarseness, nor does he award prizes for freak-shaped vegetables. It ils a great temptation to exhibit the over-sized carrot or cabbage but as a usual thing these oversized individuals do not have the quality which will win the money. Nor should a few large individuals be exhibited with a number of smaller ones to make up the sample, but look out for quality first of all.

Then the samples should be sound and marketable. Disease spots will count against the sample and here is an important point. Vegetables such as roots like carrots, beets, turnips, and potatoes, should be clean. This doesn't mean that they should be scrubbed with water before they are shown. It is. rather bad practice to scrub these root vegetables with water in preparing them. It is much better to use a soft brush which will remove all the dirt. This will usually clean them up sufficiently. It is very seldom that water needs to be used. On the other hand, if the dirt is difficult to remove with a dry brush, then rather than exhibit a dirty sample, wash them very carefully so as not to injure the skins. This is especially true in speaking of potatoes. Root crops show soft and natural color much better when the dirt has been merely removed with a dry brush. Keep the sample just as uniform as possible.

LOSS FROM SMUT AVOIDABLE.

Attention is frequently drawn by the Department of Agriculture during the early spring season to the yearly loss ustained by this province in farmers neglecting to treat seed grain for smut, and although the number treating during this season for the first time has been very considerable, as the inquiries reaching this office for directions for using the different methods of treatment have been many, still in looking over the growing fields at the present time we notice heavy losses from smut or black heads in oats.

In some fields every fifth or sixth head is affected, and the crop reduced to that extent, while on close examination the loss in many others will be 10 per cent or greater. These black heads rot off and in high winds blow down and are often overlooked at harvesting, but at the present time them are easily recognized, and the percentage of infection can be noted. It will convince anyone who takes the trouble to look into this important matter of the necessity of treating all seed oats in future.

We have examined fields this season in which the loss is easily 20 per cent. This in a one thousand bushel field would mean a loss to the farmer of two hundred bushels of oats, worth that number of dollars, and a corresponding loss of straw which could have been prevented by the application of $3.00 worth of formalin and a very few hours' work.

Let every grain grower examine his fields, note the condition, and plan to have all his seed properly treated in future years.

Department of Agriculture.

TWENTY YEARS OF FERTILIZERS IN AN APPLE ORCHARD.

(U. P. Hendrick and R. D. Anthony, in New York State Agricultural Experiment Station Bulletin 460, pp. 71-96. Geneva, N. Y., 1919.)

Bulletin 339 of the Station gave the resolts for the first seven harvests in a fertilizer experiment which was begun in the Station grounds in 1896. The present bulletin discusses the results in eight additional harvests. The factors considered in interpreting results are yield and size of fruit and tree growth Detailed tabular records are given for each tree included in the experiment. The results secured on ach plot are summarized and discussed.

As measured by yields, acid phosphate at the rate of 340 pounds per acre per year has been of no benefit when used aolne. The addition of 196 pounds of muriate of potash to the 340 pounds of phosphoric acid apparently increased the yields, but the annual addition of 50 pounds of readily available nitrogen to these amounts of phosphoric acid and potash has caused no increase in yield. Plats receiving stable manure have yielded no more than the check plats. There has been a tendency for the checks and phosphoric acid plats to take a slightly lower rank in yield as the experiment has continued. In general the results are so contradictory that no conclusion of practical value can be drawn from the yields.

As measured by size of fduit, there is a greater difference between two nearby checks than between any fertilized plat and its nearest check. This, considered in connection with the variations among the duplicates of the fertilizer treatments, makes it impossible to draw any definite conclusion as to the effect of the treatments on size of fruit.

As measured by tree growth, the two phosphorous and potassium plats lead their adjoining plats. both in size of trunk and in tree volume, but it was impossible to conclude whether the increases were due to the potassium or the combination of the two elements, or to some tree or field variation which does not now show. Heavy applications of nitrogen in a complete fertilizer and in manure have not increased tree growth.

As measured by the costs of treatment, certain plats have given increases sufficient to equal the costs, or even to show a profit. Similar treatments in other plats have resulted in a loss.

Summing up the results of the experiment as a whole, the authors conclude that if the results continue in the present direction for another ten years. the increased yields may justify the recommendation of one or two of the treatments given; but at present this can not be done. Attention is called to the fact that these results are from a cultivated orchard on coil naturally well supplied with the plant feed elements. On thin, unfertilized, or in sod orchards the results might be quite different.

HORTICULTURE.

SPRAY-COVERED APPLES

Mr. Dwight Woodruff, Eastern representative of several of the large Northwestern apple growers' associations, is issuing a timely warning to growers to exercise more care in order to avoid having an excessive amount of spray on the fruit. A portion of Mr. Woodruff's letter in regard to this was recently published in the excellent little bulletin which is now being issued by the Yakima Fruit Growers' Association, and was occasioned by the action taken by Boston health authorities last winter who condemned several carloads of Northwest apples on account of the excessive amount of arsenate of lead spray on them. In discussing this subject Mr. Woodruff says:

"I think it is something that should have your early attention at the present moment, because I have talked with different factors in the East on this very subject and they all seem to think that the federal health authorities and the various boards of health throughout the country, especially in the big markets, are going to be on the lookout this season, and we might just as well plan to avoid trouble. All of this is to advise you so that you will not ignore the situation, and do not think for a moment that this is a Boston matter, because it is not."

To growers who do not wipe their apples before packing this is an important matter, notwithstanding the fact that experiments by experts have demonstrated that the number of apples that would have to be eaten to cause injury or sickness on account of the spray on them is beyond the consumption of any one human being. The point of the matter is in the fact that Eastern health authorities look on the substance left on the apples as highly poisonous and have evidently decided to discriminate against them if they are discolored by an excessive amount of spray material. With the keen competition that is now arising in the East from Eastern growers who admit that the markets for fancy apples are being taken away from them by the superior pack and finish of Western fruit, the Western grower should leave nothing undone to place his fruit on the market in the finest of conditions. It is easy to understand how a campaign against Western appleh could be inaugurated by having the health authorities or others whose purposes would not be so altruistic declare that they were poisonous or unhealthy.

The safest plan will of course be to have the fruit wiped, but if this is not to be done, then Mr. Woodruff's suggestion of avoiding the excessive use of spray should be adopted.

A PRACTICAL DEMONSTRATION OF FRUIT THINNING

By C. A. Noren

Now that the apples are packed and sold it is easy to obtain facts and figures relative to the value and advisability of thinning apples.

I have obtained four sets of comparisons of well thinned and poorly thinned orchards.

In three cases the orchards adjoin each other so that the conditions under which they were grown are very similar. Further, these figures were obtained from four different warehouses and therefore should be representative. The tables were figured on a basis of 1000 boxes to make the results more comparable.

The first comparison is that of two adjoining orchards, Jonathans, both of them well cultivated.

Well Thinned Orchard—990 boxes of 4½ tier and larger apples; 10 boxes of five tier apples.

Poorly Thinned Apples—675 boxes of 4½ tier and larger apples; 170 boxes of five tier apples; 155 boxes jumbles. The Jonathan being medium sized, there is no excuse for having so many small apples from this orchard. The owner did not think it paid to thin.

Table two is a comparison of two adjoining Winesap orchards on similar soils.

Eight hundred and twenty-six 5½ tier and larger; 77 boxes five tier, and 97 boxes jumbles.

This orchard had better than the average thinning.

Three hundred and eighty-seven 4½ tier and larger; 315 boxes of five tier and 298 boxes jumbles.

A poorly thinned orchard. From the above table it will be seen that the fruit runs 86.6 per cent 4½ tier and larger in the well thinned orchard as against 38.7 per cent.

The third table is that of two Winesap orchards not adjoining each other but on similar soil and both in alfalfa.

Well Thinned Orchard—963 boxes of 4½ tier and larger; 20 boxes of five tier and 17 boxes jumbles.

Poorly Thinned Orchard—200 boxes 4½ tier and larger; 447 boxes five tier and 353 boxes jumbles.

The first orchard runs 96.3 per cent 4½ tier and larger as against 20 per cent in the latter.

The fourth table shows the comparison of two adjoining Winesap orchards on similar soils and on clean cultivated ground.

Well Thinned—950 boxes 4½ tier and larger and 50 boxes five tier.

Poorly Thinned—500 boxes 4½ tier and larger and 500 boxes five tier and smaller.

Figured in actual money loss per 1000 boxes it varies from $152.50 in the case of the Jonathan orchards to $535.60 in third table. Add to this the additional cost of handling the smaller apples because of there being more of them, the loss is still greater.

Another fact which might be brought out is that the larger apples invariably run a higher percentage to extra fancy than do the smaller apples. Following are figures from two orchards in the comparison tables showing some interesting figures. In the well thinned orchard the packout was:

Seventy-three per cent extra fancy; 10 per cent fancy and 17 per cent C grade.

In the poorly thinned orchard we have: 47 per cent extra fancy; 27 per cent fancy and 26 per cent C grade.

Later it was found that all the "fancies" had to be marked C grade on account of lack of color, making a total of 53 per cent C grade apples. The loss in the second orchard amounts to $330.

The loss in money due to small fruit during the past year is the least item to be considered. The reason for the small fruit as shown in the tables is due to the fact that the trees bore too many apples, or, in other words the trees were not properly thinned. It is a known fact that it requires greater effort on the part of the tree to mature the core of the apple than the edible portion. It must then follow that a tree can mature with less effort ten boxes of apples averaging 150 to the box than ten boxes averaging 200 to the box. A tree can properly mature a certain amount of fruit and anything over that will cut down the size of all the fruit as well as the quality.

If a tree overbore this year, due to lack of proper thinning, more fruit spurs bore fruit than was actually necessary. This put too great a strain on a large number of fruit spurs and as a consequence they did not set the necessary fruit buds for next year, and further, the trees did not make the normal growth. Now then, it can readily be seen that the possibility of heavily loaded trees this year having a normal crop next year is small.

Alternate Bearing

Now we have arrived at one reason for the alternate bearing of fruit trees which applies especially to the apple. Taking a period of ten years the most profitable orchard is the one which bears an average crop every year. The alternate method of bearing fruit requires about the same amount of care and expense on the off year as it takes to bring through a full crop.

A tree has its limitations in the amount of fruit it can bear just as much as a man is limited in the amount of work he can do.

The real loss by allowing the tree to overbear one year comes the following year when a short crop is the result.

Overbearing retards normal growth of trees.

Overbearing one year does not give the tree a chance to set fruit buds the following year.

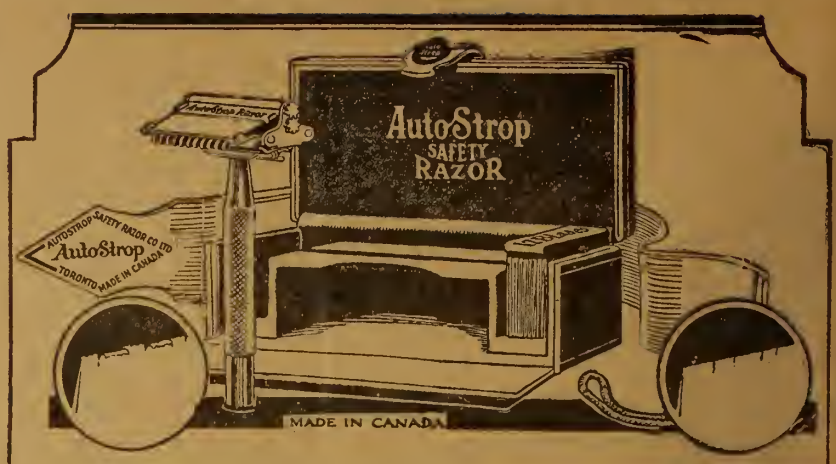
WIREWORMS

Wireworms have brown, shiny skins with segments showing plainly, from three-fourths to one and one-half inches in length, being slender and cylindrical in shape, and having a tough, wiry look. There are three pairs of legs protruding from the first three segments of the body.

Being slow to develop, they remain in the larvae state two years or more, hence many are found the first, and some the second year, after breaking the sod plot.

The wireworms live on the roots of the grass, but the roots being so numerous, the injury is not seen; but when corn is planted in infested fields, the roots being greatly reduced in number, the injury of the pest consequently becomes serious.

The wireworms usually change to pupae and transform to beetles from July to September. The beetles are known as snap-beetles and are from one-half to three-fourths of an inch



Edge Before Stropping (Magnified)

Edge After Stropping (Magnified)

ONLY a sharp blade gives a perfect shave. An unstropped blade cannot give as good a shave to-day as it did yesterday and must soon be discarded.

The exclusive self-stropping feature of the AutoStrop Razor ensures from each blade as perfect a shave each day as the day before. It is as easy to clean as to strop—nothing to unscrew or take apart.

Any dealer will gladly demonstrate the AutoStrop Razor to you, guarantee satisfaction, or refund of purchase price.

Only $5.00—complete with strop—twelve blades in an attractive assortment of cases to suit any purpose.

in length, dark brown in color, and often with dark markings.

Control

If the land is to be used to plant corn on, and known to be infested with wireworms, to counteract their ravages, the sod should be plowed soon after the hay is cut and deeply cultivated at intervals for the remainder of the season.

Clover could be used to follow the sod, as the pest does no injury to same.

Very late fall plowing is also recommended. If planted to corn and the worms are found to be present, deep cultivation should be used.

Rotation of crops combined with the above recommendations are the only means of handling the pest, as no application to the soil can be made strong enough to kill the pest without killing the crop.

NATURE AND CONTROL OF APPLE SCALD

A contribution from the Bureau of Plant Industry, U.S. Department of Agriculture, in which the authors summarize their earlier work on the nature and control of apple scald, and give the results of more recent investigations on this subject. A list of cited literature is included.

The experience as a whole show that the occurrence of apple scald is determined by orchard, packing house, transportation, and storage conditions. Mature fruit has, in general, scalded less than immature, but fruit in which the surfaces were just changing from green to yellow have scalded worse than those that were a leaf green and worse than those that had more completely changed to yellow. Well-coloured red fruit surfaces have been practically immune to scald.

Apples from trees receiving heavy irrigation have scalded worse than those from trees receiving light irrigation. This was found not to be due to the greater number of large apples in the former case, but to some forcing effect that increased the susceptibility to scald in both large and small apples. Delayed storage has increased or decreased apple scald, depending upon the amount of aeration the apples received during delay. Apples in ventilated barrels have developed less than one-third as much scald as those in commercial barrels when both were held in a storage room that received an occasional ventilation. but where the storage room received little or no ventilation the ventilated barrels caused but little decrease in scald.

The amount of scald developed in cold-storage plants has varied greatly with the location in the room. Apples near the aisle or near a door have scalded far less than those in the bottom of the stack. Boxed apples exposed to a continuous air current of 0.88 mile epr hour in a commercial storage plant have been practically free from scald, while similar apples that did not receive the constant fanning became badly scalded. Stirring of the storage air has been found more important than its renewal in the prevention of apple scald. The ordinary commercial apple wrappers have caused but little decrease in scald, and paraffin wrappers have been but slightly better, but wrappers impregnated with various fats and oils have either entirely prevented the disease or reduced it to a negligible quantity. In barrel experiments in which only part of the fruit was wrapped, scald has been greatly reduced on the apples adjacent to the wrapped ones as well as on the wrapped apples themselves.

Typical scald has been artificially produced in a few days' time by exposing apples to the vapors of ethyl acetate, amyl acetate, or methyl butyrate. The manner in which scald can be produced artificially and the different methods of control indicate that the disease is due to the accumulation of esters or similar products of the apple in the tissues of the fruit and in the surrounding air. The vapours of these substances can be carried away by air currents or absorbed by fats and oils.—C. Brooks, J. S. Cooley and D. F. Fisher in Journal of Agricultural Research, Vol. 18, No. 4, pp. 211-240. Washington, D. S., November 15, 1919.

HOW TO KILL YOUR FARMERS' CLUB

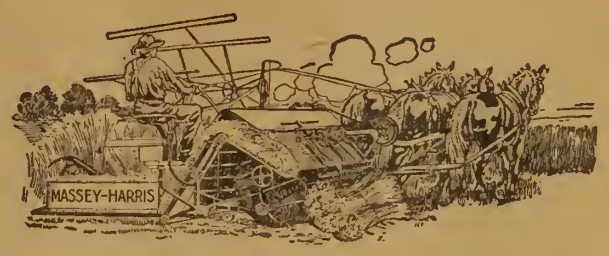
1. Don't come to the meetings.
2. But if you do come, come late.
3. If the weather doesn't suit you, don't think of coming.
4. If you do attend a meeting, find fault with the work of the officers and other members.
5. Never accept an office, as it is easier to criticize than to do things.
6. Nevertheless, get sore if you are not appointed on a committee; if you are, do not attend the committee meeting.
7. If asked by the chairman to give your opinion regarding some important matter, tell him you have nothing to say. After the meeting tell everyone how things ought to be done.
8. Do nothing more than is absolutely necessary, but when other members roll up their sleeves and willingly, unselfishly use their ability to help matters along, howl that the association is run by a clique.
9. Hold back your dues as long as possible, or don't pay at all.
10. Don't bother about getting new members. "Let George do it."

ROADSIDE WEEDS—OUT OF BUSINESS.

The cutting of roadside weeds is associated. ordinarily, with thought of the prevention of the distribution of seed from noxious plants. This is well and good, and to this end alone it would serve better purposes if weeds were cut earlier in the summer and more often than usually is the case. The influence of roadside weeds, however, in the maintenance of earth roads, is not fully appreciated. In the proper upkeep of dirt roads it is essential that surface drainage be as free and unobstructed as possible. Only by the removal of surface water soon after it falls and its conduction as rapidly as possible into such natural channels of elimination as brooks and streams can the earth road recover speedily from its greatest handicap—a surplus of moisture.

Roadside weeds operate oftentimes to hinder this process very materially. It is not unusual to see ditches so filled with a rank growth of vegetaation as to render them entirely invisible to sight. Such conditions, of course, constitute a menace to traffic and where the ditches are deep enough serious accidents are apt to occur. The heavy stand of weeds nullifies in considerable measure the very purpose for which the ditch exists. Leaves, twigs and rubbish catch upon the weeds and obstruct the ready flow of drainage. Roadsdie weeds should be cut at least three times a season: first, just after spring growth has reached its maximum, again in mid-summer, and finally after the growing season is over but while vegetation is still green. This last cutting will leave the ditches less obstructed through the fall and winter.

Massey-Harris



Thirty-Nine Years a Favorite

THE general goodness, convenience of operation, simplicity, and reliability of the Massey-Harris have made it the favorite binder ever since its first appearance on the market some thirty-nine years ago. Years of satisfactory service have commended it to thousands of owners the world over.

The Massey-Harris is the binder for all conditions of crops. Tangled, heavy, up or down, long or short the Massey-Harris puts all the grain and all the straw into the sheaf. To own one is to know that your crop will be harvested quickly and surely.

DAIRYING.

THE CITY MILK SUPPLY.

(Continued from last issue)

In New Brunswick

Both Fredericton and St. John in the province of New Brunswick reported the requiremnts demanded in their city by-laws. The standards in both cases are almost identical. In each case butter fat requirements are 3.25 per ecnt, while the total solids are 11.75 per cent and 12 per cent respectively. Control over milk distribution is exercised by inspectors, who investigate the conditions of the dairy farms, dairies, etc., and collect samples from the farm milk cans, or from other vessels in which the milk is delivered. The bottling is done under sanitary conditions and frequent inspections of the premises are made. Tuberculin tests of cattle are made when necessary by qualified veterinarians. Milk producers supplying Fredericton require a license to sell or ship milk to the city. In St. John the milk vendors are licensed. In the first-named city the examinations are made in a private laboratory, while the latter city has a municipal laboratory.

In Quebec.

Quebec, Montreal, and Sherbrooke are the representative cities of the province of Quebec furnishing information on this subject. The standards in each case vary slightly, the butter fat content being 3 per cent for the two latter and 3.25 for the former city. The total solids required are 11.75 per cent, 12 per cent and per cent respectively. No standard with reference to the number of bacteria per cc. is specified. Through careful inspection of the premises of producers and dealers by men appointed to carry out this work, and assisted, where necessary, by the police to investigate complaints, ample protection is afforded the consumer.

Three classes of milk are recognized in Sherbrooke, namely, raw, pasteurized, and certified. In the other two cities the classification is not emphasized, but Montreal has provided for this in a new by-law at present before the ciy council. In most cases the pasteurization requirements are 145 to 150 degrees F. held for thirty minutes, and immediately cooled to 45 degrees F.

The federal requirements with reference to the tuberculin test are supplemented by municipal by-law in the case of patrons shipping milk to Quebec City. Montreal has no special by-law, while the demands of the Sherbrooks patrons only affect those supplying certified milk, which amounts to about 4 per cent. of the total milk supply for that city.

In Ontario

Eight Ontario cities provided information concerning their milk suplpy. The twin cities of Port Arthur and Fort William recognize the provincial standards with refernce to butetr fat, total solids, and bacteria. Periodical inspection of both dairy farms and milk depots is made by sanitary inspectors. No certified milk is supplied in either city, but Port Arthur recognizes two classes, raw and pasteurized, and requires that pasteurized milk be held at 70 degrees C. for 20 minutes. This city also demands that tuberculin test be made of all dairy cows by a veterinarian under the direction of the federal government. The Fort William authorities recently issued a circular containing suggestions, hints, and warnings, and sent these to all parties engaged in supplying milk to the city. The details of this circular are embraced in the poster issued by the city of Halifax and already reproduced in this article.

The cities of London and St. Thomas have regualtions that contain many points in common. Their standards are identical. Vendors before selling in these cities must secure licenses, for which a fee is charged. They must also apply to have their cattle, premises, and equipment inspected, and agree to observe the provisions of the corporation by-laws before receiving a permit enabling them to conduct business.

Hamilton, Toronto, Ottawa, and Guelph were the otber Ontario cities reporting. Their by-laws and regulations correspond very closely with those of the cities before mentioned. In every case it was difficult to report on the amount of milk consumed daily per capita, the reason for this being that a number of citizens, es-

In a nutshell

FIVE words—"Skims clean at any speed"—tell one of the basic differences between the Sharples Suction-feed and *all other* separators.

Other Separators *lose* butterfat when turned "under speed," and tests prove that 95% of all hand separators are turned under speed much of the time.

Sharples' simple one-piece bowl (no discs) knee-low supply can, "once-a-month" automatic oiling system are also *exclusive* Sharples advantages.

It is costing you more to be without a Sharples Suction-feed than it would to buy one.

One type of Sharples Suction-feed Separator is electrically operated with current from farm lighting system.

"There are no substitutes for dairy foods."

pecially on the outskirts of the cities, keep their own cows and in some cases supply their neighbors. Even an approximate estimate cannot well be made because of the use of powdered and condensed milk in many households.

The city of Toronto specifies that the bacteriological count shall not exceed 250,000 per cc. in winter, or 500,000 per cc. in summer, also that all milk must be sold in bottles.

The pasteurization requirements in Ontario, as defined in the provincial Milk Act, demand that the milk be held at 140 degrees to 150 degrees F. for twenty to thirty minutes and cooled at once to 45 degrees F.

In Manitoba.

Winnipeg and Brandon report rather fully, while Portage la Prairie makes the statement that the regulations of that city call for 3½ per cent butter fat, and that cows be subjected to the tuberculin test. In the latter city more than half of the people have to use condensed milk, owing to the scarcity of the raw product.

Winnipeg has a Sunday delivery, which is also true of practically all the cities reporting, with the exception of Brandon and Ottawa. In Ottawa there are two deliveries on Saturday but no Sunday delivery, while in Brandon the Sunday delivery is not general.

In Saskatchewan

The reports for Saskatchewan are From Regina, Saskatoon, and Moosejaw. The standards for the first named city are 3.25 per cent. butter fat and 12 per cent total solids. For the second, 3.5 per cent butter fat and 12 per cent solids, while for the last the requirements are 3.25 per cent butter fat and 11.75 solids.

Regina stipulates that milk must be properly treated and handled at the point of production. As soon as it is drawn it is removed to the milk house, strained, and cooled. Milk must not leave the farm or be sold at a temperature above 50 degrees F. It must be shipped in sanitary milk cans and retailed in bottles. All milk is retailed in covered waggons, which are clean, fly proof, dust proof, and frost proof. The dairy farms supplying milk to Regina are periodically inspected. Barns and milk houses must comply with the regulations laid down in the dairy by-law. The cleanliness of the milk is ascertained by frequent bacteriological counts and sediment tests. Three classes are recognized, first, certified, second, milk from tuberculin tested herds, and, third, pasteurized milk. About five per cent of the milk sold is certified. The laboratory work is carried out by arrangement with the laboratory at the Regina General Hospital. The tuberculin test of the dairy animals is carried out under regulations issued by the Veterinary Director General governing municipal dairy testing, and the test is conducted by officials of the Dominion Health of Animals Branch.

Milk Vendors in the city of Regina secure a license costing five dollars, while the dairies authorized to ship milk to a pasteurizing plant are supplied with a permit free.

The report from Saskatoon indicates that that city supervises the milk supply quite as carefully as does Regina. It demands that all dairy farms conform to the city regulations before licenses are granted. The tuberculin test is applied to the herds and regular inspections are made by the inspector in charge. A score card is used showing methods and equipment used by the dairymanu. At any time these do not prove satisfactory, his name is removed from the list and his license is cancelled. This practice is also observed in the care of a number of the cities in Eastern Canada. The pasteurizing depot, according to the Saskatoon regulations, must be of good construction, located on sewer and water mains, contain not less than three compartments, namely a handling room, a wash-room and a storeroom, all with concere floors. Before operating, the plant must secure a permit and the equipment must be satisfactory. No raw milk can be sold from the pasteurizing depot. The system of pasteurizing is practically the same as that adopted by other cities, namely the "Holding System."

It is stipulated in the Saskatoon regulations that the dairy barns must have not less than two square feet of window glass per animal. The floors must be of satisfactory material and substantail. Not less than four hundred cubic feet of air space per cow is permitted, and one square foot of air outlet through the roof for every ten head, and inlets to admit fresh air of equal amount, is demanded. These requirements all go under the head of tuberculin inspection, and the tests are carried out by veterinary inspectors of the federal Department of Agriculture.

In Alberta.

The standard required by the Alberta Public Health Act for the milk supply to cities is butter fat 3 per cent and total solids 12 per cent. Three cities in Alberta reported, namely, Edmonton, Calgary, and Lethbridge.

Edmonton has an efficient inspection service, and all milk utensils and premises are periodically inspected each year. During about ten months of the year practically all the milk is hauled into the city by the producers, who are licensed to sell or ship the milk if their premises upon examination are considered satisfactory.

The inspection service in Calgary is very similar. Three classes of milk are recognized, namely, raw, pasteurized, and nursery milk, which compares with certified milk. The milk for Calgary comes from a radius extending eighty miles; while for Lethbridge thirty miles is the most distant point from which milk is shipped, there being a depot in a small town that distance away at which milk is pasteurized and shipped in by train.

In British Columbia.

From British Columbia only one report was received, that from Vancouver. The standards there are butter fat, 3.25 per cent, total solids, 11.75 per cent, bacteria maximum, 750,000 per cc. and pasteurized 15,000 per cc.

The public control exercised over milk distribution is stated in detail. A qualified inspector daily visits and inspects the dairies in the city, maintaining cleanliness in utensils, machinery, and premises. Samples of milk are taken for bacterial and chemical examination. Waggoners are subject to daily inspection, and from them samples of milk are secured for chemical and bacterial tests. This work is also carried on at the farms by the provincial government inspect-

Will It Last?
The Final Test Of Any Roofing

WHY spend a lot of money on an unknown roofing material, one that is not backed by past performances? Whether it is a small job, or an industrial plant covering acres, that is to be roofed—make a lasting job of it by using a roofing that is worthy, one that will stand up to hard wear and changeable weather conditions.

NEPONSET PAROID

gives just this service on every description of roof, from the largest of railroad buildings and factories, down to the humblest of sheds.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively waterproof and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

Satisfy yourself when ordering roofing that it is Neponset Paroid.

EASY TO LAY—With every roll is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

ANIMAL HUSBANDRY

By Dr. Chas. D. Woods, Director of Maine Experiment Station

For more than 50 years, careful attention has been paid to breeding of dairy cows. And the improvement, while in some instances marked, is far from what the breeder desires. The practice of breeding from the best on the assumption that like begets like, does not by any means give uniform results. Animals that are expected to be large producers often prove the reverse; and the occasional prodigy fails to have daughters of her class.

As the breeding has been and still is without knowledge of how milk and butterfat production are inherited and reliance was and is placed upon mass breeding, that there are no great gains is not to be wondered at. The breeding is for the most part based upon a hypothesis then regarded as a law, and which we now know to be only partially true, that "like produces like."

In 1911, when the Maine Agricultural Experiment Station announced that it had found that for poultry, high egg production was transmitted through the sons rather than through the daughters, the idea that this might be true in dairy cattle as well as in poultry seemed to take hold upon the dairymen of the country, and in some breeds they began advanced registries for sires based not, of course, upon their own milk production or that even of their dams, but of the milk and butter-fat production of their get.

This thought appealed to the Maine Dairymen's Association very greatly, so much so that they appointed at their meeting in 1911 a committee consisting of Rutillus Alden, W. G. Hunton F. S. Adams and Raymond Pearl, "to provide ways and means whereby either by private endowment or state appropriations sufficient funds may be provided for a series of years to enable the Maine Agricultural Experiment Station to undertake an investigation of the problems of breeding for increased milk and milk fat production on as broad and as thorough a basis as has been so successfully carried out in the past 15 years with breeding poultry for increased egg production."

This committee decided that the most feasible way to obtain this money was to ask a continuous appropriation in favor of the Maine Agricultural Experiment Station from the Legislature, and it was planned to ask for $10,000 annually at the Legislature of 1913. At the two preceding Legislatures the College of Agriculture, through the trustees of the University of Maine, had been seeking an appropriation for the construction of much-needed new barns. It was rather feared that the Legislature would not be so likely to give two appropriations if the larger amount was asked for the animal husbandry investigation; and in order to strengthen the position of the College of Agriculture they proposed to furnish the animals needed for the experiment together with housing room, with the understanding that the committee would reduce its request to the Legislature to $5000 and assist in getting the appropriation of $5000 a year annually in favor of the Maine Agricultural Experiment Station for animal husbandry investigations and made a liberal appropriation for the construction of the new barns for the College of Agriculture.

The State Dairymes knew that a long time must elapse between the beginning of the definite breeding cross-bred experiment and obtaining results that would adequately answer the fundamental question of how milk and butterfat are inherited. But there were large amounts of available data that had not been analyzed and these studies together with co-operate experiments with breeders have been carried simultaneous with the major proposition. These inquiries have and are giving results of high importance, which are being published from time to time. Up to Jan. 1, 1920, 29 publications aggregating 762 pages have been issued. Important as these results are, they are dependent for their full interpretation upon a knowledge of the laws of inheritance. Such knowledge would remove the uncertainty from breeding and be worth millions of dollars to the world.

Money In Hogs. Yes, and all other live stock too—Canada is fast becoming a live stock producing country. Pasture and yards must be well fenced.
Peerless Perfection Fencing
THE FENCE THAT'S LOCKED TOGETHER
Made in Canada. Quality worthy of the name and nation. A fence of defense. The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting. If you are considering the fence question, let us estimate on your job—and advise with you as to the best way to build—we will put you in touch with our nearest agent. Send for our latest catalog. Ask about our poultry fencing, ornamental fencing and farm gates. Catalog mailed free on request.

SELECTING BREEDING SWINE

One of the most important features of swine breeding is the selection and management of the herd boar. The influence of the sire in the herd is greater than the dam, therefore we have the necessity for careful selection and management. His power of transmission and desirable breeding qualities are largely indicated by the immediate ancestors.

Another important factor is individuality. The head of the herd should closely resemble the ideal of his type and be a true representative of his breed. He should have a pronounced masculine appearance, indicated by a strong development of the head, neck, shoulders, chest, bone and organ of reproduction; for these characteristics represent vigor, constitution and prepotency. The boar may be an extremely valuable individual, but if he is not properly cared for he will give very poor results. To give satisfaction the sire must have a properly-balanced ration, the amount depending upon the degree of maturity to which he has attained and the number of services which he performs.

His quarters should consist of a clean, dry, warm, well-lighted and ventilated house with yard adjoining for exercise and service. Exercise is very important and the boar should be penned up only during the breeding season. It is essential that he be kept in a good, healthy, vigorous condition at all times.

In the selection of the brood sow, it is essential that uniformity of size and quality be maintained. A sow of uniform size and quality will produce a uniform litter of pigs which will command a higher price on the market than would a litter of no particular type. Select a gilt from a sow that is a good performer, a sow that gives a good quality of milk and one that produces vigorous, growthy pigs, but the performance of sire and dam should not be overlooked.

It is essential that the young sow be fed a growing ration in order that she may as nearly as possible reach maturity before the breeding season arrives. As the breeding season approaches the sow should not be in hivh condition, but she should be on the increase a few weeks before breeding. An increase should be made in the feed so that she will be in the most vigorous condition when bred.

Yet, no definite amount of any ration can be recommended for sows under any condition. Success with any ration is the result of watching the condition and health of the animal and regulating the feed accordingly. Just before farrowing, feed the sow to avoid constipation. For eighteen to twenty-four hours after farrowing she needs no feed, leaving the feed proposition entirely to the sow's willingness to eat. She will be feverish and will drink a large quantity of water.

The grain ration should be gradually increased for at least ten days to two weeks when she should be on full rations. As the young pigs make their most economical gains while sucking the sow, she should be fed for a maximum milk production.

Small size, small bone and weak constitution are factors in hog development which have been appearing regularly in the past few years in the herds of farmers and breeders of pureberd swine. In the study of the cause it should be ascertained if such defects are confined to any one strain of blood or breed of hogs or if its presence is more marked in some strain of blood or breed than in others. It has been observed that breeders selecting their stock for quality exclusively sacrifice size, constitution and strength of bone. The use of immature sows for breeding purposes may also result in a reduction of size in the sows and in undersized pigs and weak litters. Immature sows haven't sufficient capacity for feed to properly develop their own bodies and produce a satisfactory litter at the same time. If breeding stock is selected from such weak litters of undersized pigs it is likely to result in the transmission of weakness and in time a herd lacking in size, strength and constitution.

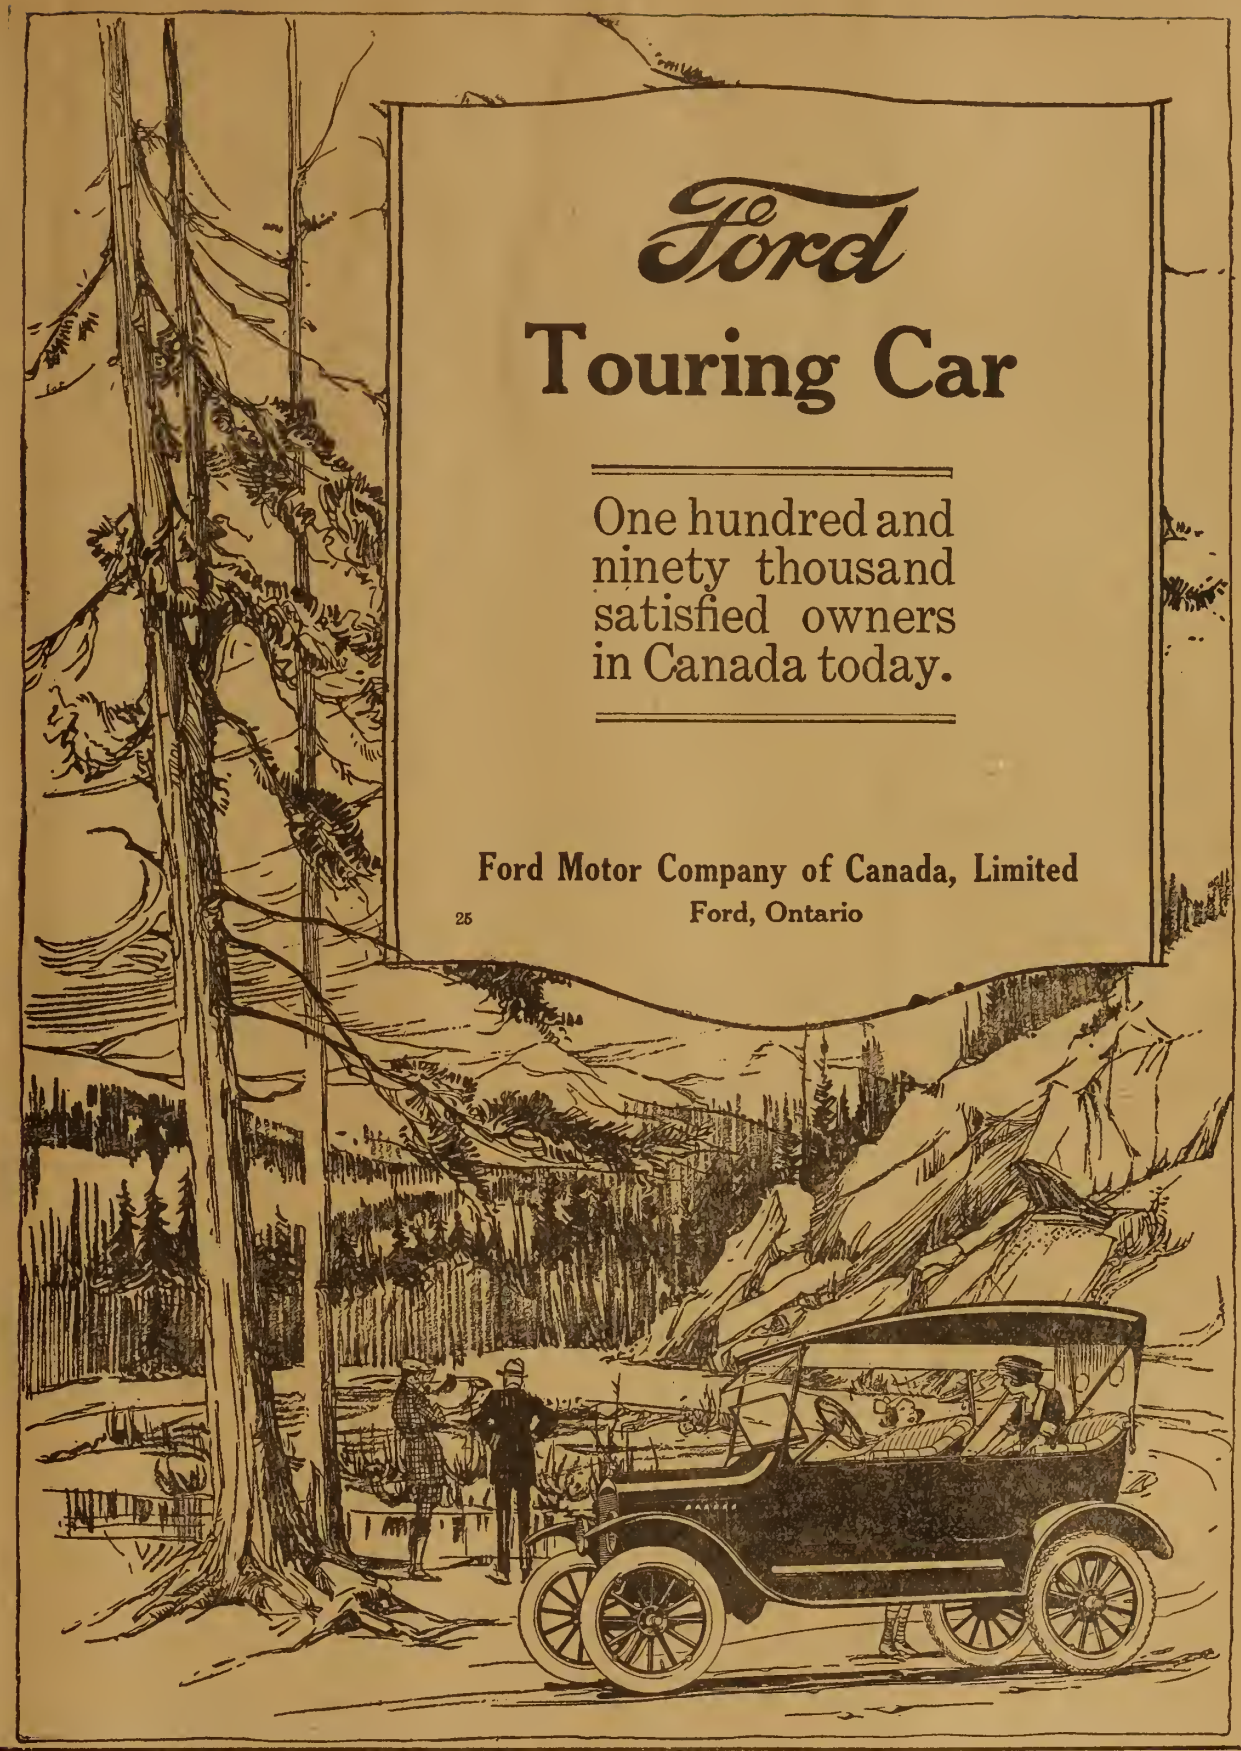
Select your breeding stock from large litters, vigorous pigs and from well-matured sows that are good sucklers. No individual possessing weak characteristics in any marked degree should be allowed to produce its kind if the law of breeding holds, which says: "Like tends to produce like."

Proper feeding is a method of remedying a part of these defects. The pigs should be fed regularly, and kept in sanitary quarters to retain good health. The feed should be of a nitrogenous and mineral nature, which is conducive to bone and muscle growth. The average farmer and breeder of today relies upon the corn ration.

The importance of mineral matter in the ration of the growing sow can not easily be over-emphasized. A large amount of protein is necessary to re-build the tissues of the sow and nourish the fetal litter. Various experimental tests show that size and breaking strength of bone was increased and that gains were produced much cheaper when a ration containing a large amount of mineral matter was fed.

Exercise for breeding stock and growing pigs is scarcely less important than breeding or feeding. It is a promoter of good health and thrift. By exercise the muscles are strengthened and, as a result, the bones become stronger, consequently we have developed a larger and stronger frame.

The large profit in swine leads men to a greater effort, giving them on the average greater success with this class of livestock. The individual investment is less. The per cent. of profit is greater and the increase larger than with cattle or horses. All this will result in the betterment of the breed, the realization of greater profits and a much greater satisfaction and enjoyment in livestock farming. The farmer must interest himself in regard to the essentials of selecting breeding stock. He must realize the importance of his selection and keep the desired end ever in view, always realizing that persistency will in the end bring results.—Joseph P. Rogers.



HEALTHY LITTERS

At breeding time make it a point to have the boar and the sows in good flesh and gaining rather than losing. Not too fattening a ration is desirable, however, since feeds that will make for bone and muscle as well as fat are needed. It has always been my practice to get the sows on to some form of pasture as early in the spring as possible so that they will be healthy, and the pigs will be much better if they come later in the season.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

THE HORSE

BREEDING FALL COLTS

The advisability of having mares produce foals in the fall rather than in the spring, depends greatly upon existing conditions. In cases where the breeder does not require his mares for work purposes during the spring and summer, and where he understands the desirable manner in which pregnant mares should be fed and handled during the winter months, and sees that the details of such are observed, the production of colts in the spring is doubtless the most advisable. At the same time there are many reasons why the practice of having mares produce in the fall, rather than in the spring, should be more common than it is. Of course, for show or racing purposes, when the animal is under four years of age, the production of fall colts is not advisable, as the ages of horses for these purposes is reckoned from the first of January of the year in which they were born; hence, a foal born in the fall would have to complete with those several months older, either in the show-ring or on the race track. But the breeder who does not show or race his horses until they reach maturity, would probably find it more profitable to have his foals born in the fall.

There is no doubt that a large percentage of the fatalities in spring colts is due to the manner in which the dams have been fed and taken care of during the last few months of gestation. Especially on farms where there are sufficient horses to perform the winter work and driving without using the pregnant mares. The latter are often allowed to pass the time in perfect idleness, often not even given box stalls to stand in, but are tied in single stalls and well fed on hay and oats, and when the weather is not fine, are not even allowed out in the yard or a paddock to take a little exercise during the day. It is an established fact that the produce of a mare that has been kept in only moderate condition and given daily exercise or light work during the whole period of gestation, especially the latter months, with few exceptions, produces a better and stronger foal than her sister which has been kept in the stable and pampered.

Then again, even where there is a disposition on the part of the owner, to exercise his pregnant mares, conditions often forbid it for a greater or less portion of the winter months. When the ground is slippery it is dangerous, even though they may be well shod, and when the snow is quite deep it is also dangerous, as the driver cannot always keep his horse or team, as the case may be, out of the deep snow, where more or less plunging often occurs, and all breeders know that undue nervous excitement or muscular exertion should be avoided in pregnant animals. All experienced breeders will admit that regular, but not excessive labor is beneficial, and all observers have noticed in the majority of cases, (as already stated) the mare that has had such during pregnancy, especially during the later months, produces a stronger foal than the one that has been pampered and kept in idleness.

When breeding mares are not required for work, the necessary exercise is obtained on pasture in the summer time, much better than by being turned out in a yard or paddock for a few hours daily during the winter. When the services of the mare are required, either during pregnancy of after parturition, we get more satisfactory service before than after the birth of the foal. All will admit that to get the best results the mare nursing a foal should be well fed, and live in comparative or complete idleness, hence we claim that, on this account, fall production is the better, as the mare can perform the ordinary work on the farm during the spring, summer and early fall, and then, after foaling, her labor is not usually required. She can then be given comfortable and roomy quarters for herself during the late fall and winter months, and in the spring after the foal has been weaned, it will be in good condition to be turned out on pasture, while the dam, if again pregnant, will be in a condition to have a season's work and reproduce again in the fall.

The feed that the mare consumes during the months in which she can be on pasture during the night tends to nourish the unborn foetus better than the feed usually given when horses are necessarily fed in the stable, and by breeding his mare as above a farmer loses practically none of her services, and at the same time increases his stock. It is seldom that the foal of a mare that has been on pasture during the later months of pregnancy is weak or delicate. Of course, the same danger of mal-presentation, causing difficult parturition, exists in one case as in the other, but the foals are usually stronger and smarter when born after the dam has been on grass for some time. There is also less danger of joint-ill when the mare foals on grass, from the fact that the germ that causes the disease is not so liable to be present in the

In Case of Colic

give your horse Dr. J. Woodbury's Horse Liniment internally—and at the same time, build up the general health and digestion of the horse, with Dr. J. Woodbury's Condition Powders.

Colic in a horse comes from the same cause as colic in a baby—acute Indigestion.

These remedies tone up the stomach, regulate the bowels and kidneys, help the digestion and soon put the animal in the best possible condition.

Dr. J. WOODBURY'S
Horse Liniment and
Condition Powders

used whenever an animal is troubled with Cough, Cold, Distemper, Glanders, Splint, Curb, Spavin, Cracked Hoof Enlargement, Cut, Sore, Bunch, Fever, these two reliable remedies will give prompt relief and change the sick, lame animal into a vigorous, healthy one.

Keep these standard preparations always in your stable in case of sickness or accident.

Carhartt Overalls

I FIGURE that when a man wears overalls he wants to be able to bend, twist or stoop freely without being conscious of them. So I purposely make my Carhartt's extra roomy, and double stitch every seam. The suspender buttons stick as if they were imbedded in concrete. Interlacing suspenders give you shoulder ease you never knew before—and they stay together in the wash, while the first-grade denim cloth I use has a staunch durability that ensures a surprising length of service.

pasture field as in the stable.

All breeders know that the production of late-fall or early-winter foals is not an easy matter, as mares do not usually show oestrum in cold weather, but we advocate breeding the mares while still on pasture. The fall colt, as stated, cannot, with equal chances, compete in the show-ring or on the race track, during colt hood, with the spring colt, but when mature should be as good or a better animal, especially if the dam of the spring-born foal has been worked during nursing, hence we think that the advisability of breeding mares in the fall is worthy of consideration.

CARE OF STALLION

In standing a stallion for profit a man should regard it as a business, with so much capital invested, and the rate of profit may be accurately fixed as in any other business. Naturally when contemplating engaging in any new line of work, the first question one should ask himself, should be, "Am I competent for that branch of business?"

If one does not consider himself to be a good enough horseman to safely handle a stallion, he should either leave the animal alone or first make himself competent to handle him. To my mind, the caretaker of a stallion should be of a quiet temperament. Nothing is more trying to a nervous, high strung stallion than the loud spoken commands of a noisy person. The caretaker should also be a person who would only use the whip as a last resort. Too free use of the whip is one of the most prolific sources of vicious stallions.

It is very important that the stallion be trained to walk and stand well. Particularly is this true of the draft stallion. A prospective patron on looking over the horse for the first time forms his opinion of the desirability of the stallion as a breeder. If he is taught to stand with his feet squarely under him and to put some action into his walk, these things will aid greatly in obtaining favorable mention from the public, and the success of many a stallion is partly due to the good appearance he makes.

A stallion used only for service requires unusual care, so that his bodily vigor will be kept at a high standard. A horse used regularly for work requires only his feed and grooming to keep him in good condition, but a stallion, often unbroken to harness, may receive no regular exercise, and, consequently, means should be employed which will secure daily exercise for him. If the stallion is a driving animal, some daily drive can usually be given which affords him the exercise he requires, but in the case of the draft stallion in the winter time, long periods may pass in which no use can be found for him. Then, if the animal is unbrokes to harness, the problem is still more complicated, for very few stallion owners feel they can afford to give the time necessary for a three or four mile walk with the animal, let alone the fatigue of the walk.

This lack of regular exercise can be overcome by giving the horse a pen of sufficient size that he may secure his own exercise. A neighbor of mine built an outside pen about 80 by 40 feet in size for his stallion. The sides are built of heavy posts, with two by four pieces spiked securely in them. Planks one and a half inch thick are spiked to the height of eight feet. This makes a thoroughly tight and safe pen. While the horse, by rearing, can show his head above the top of the sides, yet he can secure no foothold on the smooth surface. In this pen he tramps and tramps all through the day. This exercise is secured each day, as the animal is left in this pen all the time except in very inclement winter weather. The bottom of the pen is made solid by the use of stone to the depth of one foot, which was cracked on top and then covered with clay. When the weather is wet the pen does not become sloppy as the horse tramps around. That the stallion must be given this exercise is imperative. All authorities agree that the cause of the failure of many stallions is simply lack of exercise. Their organs are clogged with poisonous waste matter.

After the question of proper exercise is satisfactorily answered, the next problem is one of feed. Authorities agree that the animal should have a balanced ration. An excess of either nitrogenous or carbonaceous matter will render the stallion practically useless. It is possible to make many combinations of feed which will give the desired result.

A good quality of mixed clover and timothy hay, about two-thirds of the former to one-third of the latter, cannot be much improved upon as the hay portion of the ration for the stallion. Alfalfa can be used instead of clover in the absence of clover, but alfalfa in too large a quantity is said to render a stallion impotent. Not infrequently are stallions fed hay more liberally than economy or healthfulness require. It is needless to say that the water supply must be good and pure.

Use some fly repellant fhen flies are bothersome.

Hens lay when fat—not too fat—and stop when thin. Look for fat on the pelvic bone; if you find it the hen is fat, if you don't the hen is thin.

The hen wtih the long, loose feathers showing lack of quality is usually a poor layer and should be removed.

The good layers is a busy hen. She rises early and retires late.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

POULTRY.

CULLING THE FARM STOCK—CONTINUOUS CULLING IS NECESSARY FOR GREATEST SUCCESS.

W. A. MAW, Madonald College.

The farms of this province have always been by far the most important source of supply for table eggs and poultry, and the annual market value of their poultry products amounts to an enormous sum. In spite of this fact the farm poultry flock is too often neglected. The hens are allowed to shift for themselves and to pick up their food where they may.

The present high price of all poultry feeds forces the poultrymen to study economy in production and the result is that the easiest way to accomplish this aim is by rigorous culling of the flock to keep the remaining flock at a reduced cost of egg production.

The farm flock generally contains birds of varying ages, culling is therefore of special importance to discard the nonlayers where no individual record is kept of the flock. The results of culling work carried on so far in other provinces and in the United States show that from one-third to one-half of the afrm flock can be culled out with agreater percentage of egg production by the remaining flock at a reduced cost of egg production.

Method of Handling.

The birds should be handled as carefully as possible so as not to excite the layers any more than necessary. A catching coop should be used. This coop should be constructed with a sliding door at one end which can be set up against the poultry house. The birds may then be driven directly into the coop from the house, thus saving time and unnecessary handling. A spare crate or coop should be at hand in which to put the culls or poor birds. These can then be sent direct to market or put into separate pen where they can be studied for a few days to check the result of the culling test. A record should be kept of the work of both pens if the ccIls are kept for any length of time.

What to Look For

On looking over the birds our first consideration is type. We want a bird having a type that shows capacity in a body set well up on a pair of strong well spread legs. The legs should be set squarely under the body. Then we look at the head for vigor and constitution and the head points and bleaching in the beak, eyering and earlobes. Following we look over the general conditoins of the feathering and the legs. In the legs we look for quality of shank and bleaching of color. Lastly we note the condition of the vent and the capacity of the abdomen.

Any hens found during June, July and August with eavy pigmented or very yellow shanks and beak can be set aside as poor producers. Such birds generally show a coarse skinned face, comb and wattles, dry feathers, a thick skinned hard or fat abdomen, and a small dry and puckered vent. These hens are the boarders and should be discarded at once as they are keeping up the high cost of egg production. As a rule they are the birds that moulte early in the summer.

On the other hand any birds found at this time with shanks and beak well faded out can be set aside as good producers. These hns will be found to possess a soft pliable abdomen covered with a soft thin skin and having good capacity shown by the distance from the pubic bones to the end of the keel and also the distance or spread between the pubis bones. The best hens will show a body length of at least four fingers and a pubis gone spread of three fingers. The head will possess a soft, smooth comb and wattles, a bright full eye and a stout and well curved beak. The quality of bone throughout the body is fine although there is found some difference in the relative thickness of bone in the different breeds.

Continuous Culling Advisable.

Continuous culling should be carried on as the poor layers generally show their indications of poor production at any season, especially from April on during the summer. The general appearance of the poor producer is quite striking after one has the characteristics fixed in mind. She lacks abdominal capacity and is dull in appearance or fleshy about the head. Her yellow legs and beak are easily detected. A great many persons have thought that the yellow legged bird was the one to keep and have therefore discarded the birds wtih bleached legs. The result has been that the poorest layers haev been kept for breeders the following year.

There is a marked difference, however, in the degree of yellow normally present in shanks of different fowls.

Presumably such differences are inherited. The poultry breeder, therefore, must discriminate between fowls whose shanks are naturally pale in color and those in which the pigmentation normally present is temporarily bleached out as a result of heavy and long continued production. It is not difficult to avoid confusion on this point if the birds are examined at the proper time. They should be culled for laying qualities at the end of the laying season, and culled again for yellow shanks at the beginning of the next laying or breeding season. If this practice is followed there should be no difficulty in having the desired yellow legs on market

Why hens go on a strike!

The feed elements that make *whites* of eggs are entirely different from those that make *yolks*. When hens aren't fed both the *white* and *yolk* making elements, they *can't lay*.

Missouri Experiment Station tests prove that 100 lbs. of wheat, corn, oats, barley and kaffir corn make (above bodily maintenance) an average of 224 yolks to 154 whites. Based on data from the same experiments, Purina formulas produce, (above bodily maintenance), as follows:

Purina Scratch Feed	247.49 yolks	142.11 whites
Purina Chicken Chowder	182.05 yolks	282.55 whites
Combined Ration	429.54 yolks	424.66 whites

These Purina feeds not only make a practically *equal* number of whites and yolks but *more* of both than ordinary feeds.

Note that Purina Chicken Chowder contains the necessary white-forming elements to balance up the yolk-making grain ration. That's why it makes hens lay so heavily. Instead of the yolks being absorbed by the hen's system, Purina Chicken Chowder makes the whites to *complete* the eggs and they are laid. Thus we can absolutely guarantee

more eggs or money back

on Purina Chicken Chowder if fed with Purina Scratch Feed as directed. You take no risk.

MINARD'S LINIMENT
King of Pain

The old reliable remedy for Rheumatism and Neuralgia, Sore Throat, Sprains, Strains, Swelling of any sort and Bruises

RELIEVED THE PAIN

Miss Ruth Tarkington, 12 Trafalgar St., St Thomas, Ont. "My grandmother was subject to rheumatism and used to call me from my playmates to go to the druggists to get Minard's Liniment. I was often unwilling and declared I hated that old stuff, but I soon found out how good it was. I got neuralgia. Grandma came with the Liniment and applied it to my head and I was very much surprised to feel how quickly it relieved the pain."

Minard's Liniment Company
Limited
YARMOUTH NOVA SCOTIA

stock along with constant improvement in egg prodution.

Where continuous culling is not practised there should be at least two regular cullings a year, one about midsummer and another in the fall.

COMMON CAUSES OF POULTRY DISEASES.

An outbreak of disease among poultry can usually be traced directly to one of four causes:

1. The first and most common is improper surroundings.
2. Improper methods of feeding.
3. Low vigor and vitality, which renders the individual more susceptible to disease.
4. Bringing diseased birds into a flock and spreading disease by contagion.

In the average farm flock the surrounding conditions have more to do with the outbreak of disease than anything else.

Cleanliness, sunshine and fresh air —Many of the farm poultry houses would stand much more cleaning than they receive. Probably the worst feature is the accumulation of droppings under the perches and in the corners on the floor. Dirty drinking pails and feed troughs also contribute their share. Lack of sunshine and fresh air does not improve matters any. Overcrowding is sure to bring on disease, especially if any one or all of the other onditions mentioned are present. Roup usually can be traecd directly to overcrowding or draughts and dampness, while tuberculosis is generally due to filthy conditions both as to surroundings and methods of feeding.

With care all these conditions can be corrected. The droppings should be leaned out once a week, which will be quite sufficient, providing cleanliness is followed in other respects.

Under all conditions the floor of the poultry house should be kept covered with straw or chaff. This helps to keep the house wseet and clean, besides furnishing excellent litter for the hans to scratch in. This straw absorbs the moisture, and also helps to dry up the droppings voided on the floor. If the house is dry and not overcrowded, the litter should be cleaned out once every two or three months. The sediment or dirt and filth collecting in the bottom of the drinking pail should be rinsed out every day and fresh water supplied. Feed troughs must be kept clean.

PUT BANDS ON CHICKENS' LEGS.

There is one thing in connetcion with the farm flock that we have found to be very important and yet it is seldom practiced, and that is putting bands on the chickens' legs showing the year in which they were hatched.

Years ago, when almost every hen had a different color or was peculiarly marked, this was not so important because you could then pick out any particular hen; but nowadays most flocks run so uniform (at least they should be so uniform) that it is hard to tell them apart.

Take a flock of Barred Plymouth Rocks, for instance. By the end of the year it is just about impossible to tell which chicks were hatched that year, and which the year before. Worst of all, it is still arder to tell which hens are three or four years old and past their period of greatest usefulness. As we all know, it is the pullets and young hens that lay best and for this reason the two-year-old hens ,and older, should be sent to the market.

A good many folks who make an honest effort to weed out their flocks each year find that when they go to do so they cannot be quite certain as to the age and other characteristics of some of the fowls. For this reason we find it vitally important that each year all the chicks kept over for breeding should be marked wtih a leg band having the year stamped on it. Then whenever one wants to send some old hens to market all that needs to be done is to look at the band on the leg.

These bands can be purchased from any poutlry supply house, mail order house or large department store. They are adjusted and will fit any sized leg.

R. S.

Disease does not start in any flock of poultry unless there is good cause for it and unles it comes into the flock with a purchased bird it is likely to develop from some carelessness or mistage of the owner. Poor feeding, feeding on only one or two kinds of feed and failure to provide grit, charcoal, shells, meat food, green food and fresh water is not only expensive, because ot does not produce results, but it is also likely to get the fowls into such condition that serious trobules will develop. Filthy, poorly ventilated, dark, sunless houses are also prolific sources of disease. The olny way to make a profit on fowls is to feed and care for them at least reaosnably well.

BUMBLE FOOT.

One of my last year's pullets has developed a lump or swelling about the size of a marble on both soles of her feet, wtih a hard, dark spot in teh ecntre. What can be done to cure it?

M. M.

Ans.—Your pullet is suffering from what is called bumble foot, and you have given the right cause, espeially where they fly down from a high perch. You had better poultice the lumps for two or three days and then lance them carefully when the hard lumps may be removed, then wash out the wound in warm water, in which a few draps of disinfetcant has been placed and bind them up again. It will be necessary to keep the bird bedded in straw or other soft litter. You can do this by keeping her in the coop by herself until the wound is healed.

The first laying year is the testing time when a hen shows her ability as a producer.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

"Judge not; the working of his brain,
And of his heart thou canst not see;
What looks to thy dim eyes a stain,
In God's pure light may only be
A scar brought from some well-won field
Where thou wouldst only faint and yield."

THE DREAM COTTAGE

ANNE averted her eyes and knitted in silence.

"He told me last Sunday, mother," continued Elizabeth, kneading the bread violently, "if he only had not taken such a dislike to father——" She broke off and closed her lips resolutely.

She was too loyal to put into words what she and her mother knew. It was perfectly true that the cost of living had soared until John's salary was pitifully inadequate—that the extra bedroom used by the old couple was actually needed for the children, that—but why go over old arguments that Elizabeth had been unsuccessfully refuting for a month that had dragged its daily length punctuated with wranglings. John detested old Peter Brown and had decided that he would no longer spare a place for him in his overcrowded home. He must go to the poorhouse. There he could cough without disturbing the family and have the benefit of the country air away from the smoky city.

Anne Brown found herself knitting her thought into the gay rap she was fashioning for little Daisy. In the years of plenty behind her she had never guessed that she—proud, carefree Anne—would ever find herself in another's home eating the bread of dependence. In the early years of married life her brick house had been the centre of gayety in the small town, and she had had everything, from an electric range to a girl to do the housework. Then her husband had failed and after years of struggling he was too feeble to work. The bank account saved for a rainy day had been cut into many times. First for Elizabeth's education and later for doctors' bills.

Now, as the two women drearily discussed the situation with frequent pauses prompted by a kindness undeserved by the implacable John, there was absolutely no money left for the Browns.

"I'll tell you, Elizabeth. Would John be willing to let me go to Pontiac and leave father here. He can easily sleep on the dining room couch, and he can help you a good deal with the work—" the old voice quavered slightly, then stopped. It was a bitter thought, this separating at their age, "and he doesn't eat nearly as much as I do—"

"Mother," Elizabeth gave up and let the tears have their way; although there has been no trace of rancor in the sweet voice, she knew the poignant emotions that were racking the motherly heart. She knew, also, that John would not permit this arrangement. Her mother did a great deal of the work and took care of the children, leaving Elizabeth free to go out and give music lessons.

"I'm afraid," she began, and the silver head nodded understandingly.

"Never mind, daughter. Don't put it into words; John is a good man even if he is stern, and I know father's pipe upsets him. I'll think of something pretty soon. You see, I cannot let father go alone to the poor farm. No one else knows what to do for him when he gets those coughing fits."

The kitchen was silent for a time. A stray bit of sunshine filtered through the alley window of the rear flat and lent a silver mistiness to the white head bent over the bright wool. Elizabeth put the bread in the oven and then looked at her mother; "I hate to ask you, but I forgot completely about John's shoes. They are to be ready tonight and I have that pupil here in ten minutes."

"I'll be glad to go and get them," assented Anne pleasantly, although the snow was falling swiftly and melting as it settled in the March mud.

Peter was asleep and the old lady pulled the patchwork quilt up about his thin shoulders. A bit of scarlet silk outlined with feather stitching winked up at her through a mist of tears, recalling the happy time when she had worn that frock as hostess to a group of her daughter's school friends. She picked up the evening paper and folded it tidily, to be placed in the rack in the dining room. John was often annoyed by Peter's habit of taking the paper to his room and forgetting to replace it in the file. Her love for Peter was partly material; he was loving and hasty and often did indiscreet things; that had been one of the reasons for his failure in the hardware store. Any one needing a friend found one in Peter, and his name was too frequently found indorsing dubious notes that not infrequently returned to him for payment.

Slipping to her knees she folded her tiny hands and made a short, almost incoherent prayer. She could stand anything, but Peter—the rules and the unceasing thought of the dependent old age—that would kill him. Already, after one month of life in the crowded city, a pensioner upon the bounty of his children, he had failed pitifully, and the woman prayed almost fiercely for some light. "Surely there is something that I can do to keep him with me," she said determinedly, as she arose and put on her wraps. If the thought of the cottage she had planned with Peter crossed her mind, she did not waste time in brooding. She had spent her money ungrudgingly upon her family and the dreams had vanished with everything else; now it was her work to build afresh. Peter should never march in to meals with rows of other weary old men. She was not very clear in her ideas of the poor farm and doubtless imagined many discomforts that would have amused the pleasant up-to-date manager of the institution, but the desolate picture was very real to her as she listened to the cough that disturbed the uneasy slumber.

As she folded the paper her eyes sought the "help wanted" column and her dim blue eyes brightened. Possibly it was the new spectacles that guided her, but she always believed it to be the prayer.

"Wanted—A man and wife to act as caretakers and take charge of 400 chickens. Apply at 7200 Harper street."

"Chickens! That would be in the country," she thought.

The number was within walking distance and Anne walked as swiftly as the slush would permit. In a short time a white capped maid admitted her to a handsome living room, where a man sat busily at a great table.

He rose courteously, but in evident surprise. Anne looked very small and frail in her black frock and little old-fashioned bonnet, but as his gaze swept the fragile face with the pale rose that of excitement lending a fleeting resemblance of youth, he started:

"Anne, after all these years!"

And Anne settled cosily in a big softly cushioned chair beside the glowing fire, forgot, in the pleasure of friendship renewed, her errand.

"How did you know where we lived?" he queried presently, as he rang for tea.

The pretty pink color faded away. "I forgot, it was so like old times here. You see——" she stopped hesitant. She could not bring herself to mention a poor farm in this beautiful homelike place. Her shabby boot stirred uneasily upon the oriental rug and the man watching her sensed her disquiet.

"You know, Anne," said the big, hearty voice, "I owe Peter more than I can ever pay in mere money. That time he paid my note for me was the time that counted big in my business. Now I want to——"

Anne lifted her head. After all, there were worse things than poverty: "Phillip, you will perhaps be surprised, but I called to answer your advertisement about a caretaker's position. Do you suppose that we would be suitable?"

His big hand reached out and grasped hers: "Anne, that's the best news I could have. This cottage was a whim of Betty's." His gaze wandered to a great painting that half filled the end of the large room. "Before her death she built it and furnished it, hoping that she would live to try a plan of hers for young couples who hated the city. It is really a little dream of a place and the prettiest flock of white chickens with rose pink combs and holly hocks bordering the picket fence and——"

But Anne could listen no longer. "Do you mean that we can go there and Peter won't have to go alone to the poor farm?"

The dark face clouded at the pitiful little secret guilelessly revealed, but he gave no sign of understanding: "It will be a great relief to me to have it off my hands. I haven't been able to do anything with it, and the girl who had lived there taking care of Betty's chickens is getting married this week and going west, so I advertised. It is the other side of the Methodist church in Franklin——"

But again the excited tones interrupted: "In Franklin, Phillip?"

"Yes, I thought you knew of it. You will be right there with your old neighbors—handy for prayer meetings—and if you care about money you can have more than you can spend from the eggs, for they are high this winter. Could you go at once?"

It was a radiant Peter who listened with an incredulous joyousness painting out the lines of pain: "It sounds," he said, slowly, "exactly like your dream cottage, Anne. There will be lots of fun for the children when they come out to stay with us."

And Anne agreed dreamily. Already she saw those beautiful white chickens with the rose colored combs, whose eggs would make living a thing of joy.

HOT-WEATHER COOKING

Careful Planning for Meals is the Best Labor-Saving Device

The terrors which accompany entertaining in hot weather, when much of our entertaining has to be done, can be nearly disposed of if we systematically introduce simplicity into our coking. This is not nearly as difficult as one would think, if all but the most necesary dishes and materials are put away at first. The sight of so few working tools at once in-

21

duces the thought of simpler food and simpler methods. There are suggestions given here for three hot-weather meals, and they should suggest others.

A few rules for serving dinners in hot weather without a maid other than oneself, may be set down in the beginning of things.

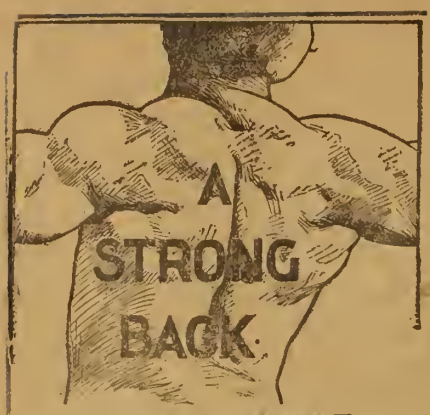
Too many courses are an abomination. A soup, a roast, a salad, a dessert, with cheese and coffee to follow, give five courses which may be managed easily. Fish should always be omitted, except in ramekins now and then, served possibly in lieu of soup, or with the roast, as scalloped oysters with broiled steak, a combination that is particularly nice.

It is entirely permissible to omit dessert, and run the salad and cheese and coffee together, thus, with a soup and roast, giving one but three courses to manage. Nice serving is always a point of honor, but formality at such necessarily informal dinners is, to quote a brilliant wit "as foreign to the spirit of things as a high silk hat on a naked Zulu."

Fried foods, meats particularly, should be cut from the menus. They must grow soggy in a tepid oven or dry and juiceless in a hot oven during the soup course, to say nothing of the inevitable smoke and odor attendant upon the frying process.

For ease in serving and economy of time and space, the oven should be utilized for the roast and for one or even two vegetables, thus letting the second course take care of itself while the soup is being served and eaten. It is here the baking-dishes come in so well for creamed vegetables, carameled sweet potatoes, and the like.

Keep the kitchen cleaned up to the last degree of order. Here is the whole secret of easy cooking and serving in a small space. For instance,



THAT IS WHAT DOAN'S KIDNEY PILLS WILL GIVE YOU.

Mrs. H. Ezarde, Cornwall, Ont., writes:—"Both my husband and myself were bothered with bad pains in our backs. A friend advised us to get Doan's Kidney Pills, which we did, and before we had finished the box we were both better, and have not had an attack since."

Doan's Kidney Pills are 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto. Ont.

be sure, before the soup is served, that nothing is left out of being washed. As the soup-plates are brought out, and before the roast is slipped from the oven on to its platter, try holding the soup-plates under the hot-water faucet; a few swift whirls will cleanse them, and then they are tucked away, sometimes dried, and sometimes not, into their usual place.

The service-plates under them are slipped into the ice-box beside the salad, to be used later for salad-plates, and with the four or half dozen soup-spoons quickly rinsed and dried and put away, the kitchen is once again in perfect order.

With jolly guests, who can entertain themselves, it is possible, if one is able to work quickly and effectively, to make almost as much headway with the debris of the main course. At least clean the plates and pile them neatly in the sink; have a small bowl or pan of water into which all the silver may be quickly dropped, put the remains of the roast and vegetables into the ice-box or on some cleared shelf, and bring on the salad with a mind clear and a kitchen undistressed.

When the salad bowl and plates are removed, scrape them quickly, drop a bit of washing-powder into the bowl, slip in the plates and forks and turn on the hot water. If there seems time for nothing else, the oil will have been disposed of, and the dishes all but washed. The cooled oven may be found a good abiding-place for the cooking vessels from which the food has been served—anything to keep the kitchen and sink cleared for immediate action.

A little experimental testing of oneself will show the easiest way, and the rule that guides another should not be followed unless it stands the individual test. It goes without saying that anything that makes the wait between the courses noticeably long is to be avoided at all hazards, and it takes quick hands to do more than pile the soiled dishes in order. If one can not manage even that, the ensuing confusion will probably swamp hostess and guests before the evening is over.

Another hint for the hostess who entertains well and wisely: it is possible to give a dinner one night and a luncheon the next day for almost the price of the dinner. Fresh lettuce for salad may be needed, but the materials for lamb ragout or creamed chicken are at hand without more than the trouble of chopping them up.

And there will be half a cupful of peas that may be deliciously creamed with a cupful or two of diced potato, or a half cupful of corn and tomato to form the basis of a delicate cream soup.

For a menu that is as elaborate as a simple taste could wish, and as easy to serve (for either four or six) from a kitchenette as from a "real" kitchen, let us try the first one given.

In this menu there is nothing to do after the arrival of the guests but to reheat the clam broth, which with the whipped cream and crisp crackers is all but ready for serving. The leg of lamb has gone into the oven an hour and a half before the dinner hour; the potatoes have followed in from half to three-quarters of an hour.

The celery has been creamed and, in its baking-dish, sprinkled with browned bread-crums, is ready to be slipped into the oven for reheating fifteen or twenty minutes before the roast is to be served.

The salad has been arranged in its bowl and placed on ice, and the plate of cheese-crackers stands ready. The iced pudding, either made at home in the little quart freezer or sent in from the caterer's, is ready in the ice-box.

The water-crackers have been browned and the Camembert made ready. The coffee, if one has not a percolator, stands measured and ready in its quota of cold water, ready to be started over a slow flame as the salad is served, and by the time the cheese is brought on it will be ready for its two minutes brisk boiling.

A luncheon for four could be easily planned for the next day. The second menu gives an example of what may be produced.

Here there is nothing for the last moment but the reheating of the cream soup. If the remains of the roast do not admit of nice slices, the minced lamb may be substituted, particularly if a hot dish is preferred. This dish may be all the more easily served if a baking-dish or casserole be lined with rice, and then be filled with the minced and creamed lamb. A sweet dessert may be added or substituted for the cheese and coffee if preferred.

City wanderers long for distinctively home cooking, and if any woman who has a kitchen be keen enough to take advantage of that longing and meet it, she may easily become the most popular hostess of the summer. The third menu suggests a "home" dinner.

This menu requires a little more supervision at serving time, and to eliminate some of it, fruit cocktails, ready to serve in the ice-box, might be substituted for the tomato bisque which would need the final touches after the arrival of the guests. The chicken, disjointed for serving, has been simmering for two hours or more. Half or three-quarters of an hour before the dinner hour potatoes are added, and with them plenty of water to more than cover—to avoid catastrophe, the kettle in which they cook must be ample in size, with a tightly fitting lid.

Twenty minutes before serving time—no more—the dumplings, which are better made of sour cream or buttermilk and must be perfect of their kind, are mixed quickly, cut into small biscuit, and dropped into the boiling broth, with the chicken and potatoes; then the lid goes on, not to be lifted again.

The corn-and-tomato mixture, already prepared, is baking in the oven. The romaine salad, with the cheese and toasted crackers, is standing ready, and with the coffee started, in this instance, as the second course is served, this "homey" dinner of three courses is served without trouble or confusion.

Another "piece de resistance" which will gladden the heart of a hungry man is a nice fat steak blanketed with

Far more effective than Sticky Fly Catchers. Clean to handle. Sold by Druggists and Grocers everywhere.

You Save Middlemen's Profits

LUMBAGO

IF you feel a touch of lumbago, you can ward off the evils of recurrent attacks, by taking Gin Pills without delay. Learn a lesson from the experience of Mr. H. A. Jukes. After suffering with lumbago for years, and being confined to the house at times, Mr. Jukes began to take Gin Pills. His letter to us reads, in part: "and much to my surprise, I at once felt a change for the better. I have been taking them at intervals, and, up to date, have had no recurrence of my old trouble; in fact, I have not felt better for years."

Don't delay. Buy a box on our money-back-guarantee, or write for a free sample. National Drug & Chemical Co. of Canada, Limited, Toronto, Ont. U.S. residents should address: Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y.

336

oysters. The steak, when broiled, has a pint of oysters poured over it, and is set in the oven to finish while the soup is served.

Mashed potatoes are sometimes avoided by the hostess who is her own cook, because of the attention they need at serving time. With the use of white of egg, though, they can be managed very nicely. Cook, mash and beat them as usual, as long as you like before the time, then beat the white of an egg stiff and fold through the potato. Then heap it in a baking-dish, and with a fifteen or twenty minutes' reheating it comes from the oven as puffy and light as if every rule of the cook-books had not been ignored.

The secret of successful dinner-giving in small quarters, lies in the menu, which involves discrimination, and in having all needful things ready at hand, and all unneeded ones tucked safely out of the way. Given these principles, any woman with the gift of cooking, and the ability to think quickly, and to act without delay upon the thought, need not hesitate to give her dinners for any number that her table will accommodate.

Dinner

Clam Broth with Whipped Cream
Roast Lamb Mint Jelly
Browned Potatoes
Creamed Asparagus on Toast
Lettuce Salad Cheese-Crackers
Nesselrode Pudding Wafers
Camembert Cheese Water-Crackers
Coffee.

Luncheon

Cream of Asparagus Soup
Scallop of Clams in Ramekins
Cold Sliced Lamb or Minced Lamb in Rice Border.
String Beans Sprinkled with Grated Cheese
Lettuce and Grapefruit Salad
Cheese Water-Crackers Coffee.

Dinner

Tomato Bisque.
Boiled Chicken with Potatoes and Dumplings.
Tomatoes and Corn Scalloped in Baking Dish or Ramekins.
Romaine Salad.
Roquefort Water-Crackers.
Coffee.

WHEN CAKE MAKING.

Work quickly: Get oven heated and all ingredients measured.

Grease pans, with lard and sprinkle with flour.

Cream the butter; add the beaten eggs and flavoring.

Beat vigorously.

Mix and sift flour, baking powder and salt together.

Add milk and flour alternately; stir as little as possible.

Fill the pans two-thirds full and hollow the centre.

General rules for cake-making direct that flour should be sifted before measuring and that butter should never be melted. If it is very hard, the bowl may be heated before creaming.

THE REFRESHING, CURATIVE PINEAPPLE.

With the coming of the pineapple season it has been brought to our attention that this fruit is of especial value to the dyspeptic and the person afflicted with throat trouble, particularly when the vocal cords are paralyzed. Indeed the "grape fruit" and "apple cure" are finding an officially recognized and most stalward competitor for public favor in the "pineapple cure."

Ripe, luscious fruit, not overripe nor underripe, but tender, sweet and succulent, is one of the most wholesome foods that come to our tables. In recommending its free use to all who would be well, Dr. David Day of the U. S. Geological Survey, who ascribes his own good health to the free use of well-ripened pines, pays this glowing tribute to its manifold virtues: "If you have one foot in the grave and are a nervous wreck from dyspepsia, drink the pineapple juice. It is the greatest tonic nature has yet offered poor man, even better as a weapon against old age and decrepitude than the sour milk diet that has made the Bulgarian peasants the longest-lived people to be found anywhere."

The juice of the pine contains the natural ferments of healthy digestion to a remarkable degree and is far better than sour milk in that it does not have to digest itself. "I really believe," declares this zealous apostle of the pineapple propaganda, "that if we adopted pineapple juice as the national beverage we would be the healthiest people on the face of the earth. We would never know what hyspepsia and indigestion are.

When iced and properly sweetened there is no drink that can equal or even be compared with it. Its active digestive pineapple "bromelin" is now being used by chemists to pre-digest beef and thus obtain a pure tonic for use as foods for the sick and convalescent.

As a digester, the ripe pine has no equal and on this account it is not well to take the fruit on an empty stomach. Failing other material for its activiteis it is apt to get in some strennous work on the lining of the stomach itself. It is better, therefore, to serve it towards the last of the meal at breakfast, or as an accompaniment or followed of the meat course at dinner, when it assists in the digestion of the food.

For diphtheria there is no home remedy that excels the juice of a fresh pine. It has often been known to cut the membrane and relieve the labored breathing when everything else failed.

The old objection to the free use of pineapples, that their price was prohibitive save during three or four months of the year, no longer exists. Not only are fresh pines plentiful in the markets now for half the year, their prices ranging according to size, quality and supply, from 10c to 35c or 40c each, but new canning industries enable us to enjoy some of the most delicious pineapples on earth. From the fields these are sent direct to scientifically clean American canneries, where they are packed in sanitary cans, covered with a syrup of pure granulated sugar, sterilized by steam, sealed and made ready for shipment without the touch of human hands.

The woody fibre that gives a hard core to most pineapples, save those grown under glass, is entirely lacking in those grown in a semi-tropical country where wood does not flourish, while pines are no higher than any first grade fruit canned under sanitary conditions.

Re Remove Stains from the Hands after Peeling Apples.—Rub the inside of the apple peeling on the part stained and yiu will find that the ugly mark will soon disappear.

"What do you think of a man who constantly deceives his wife?"

"Think of him! I think he's a wonder."

1 Pill a Laxative.
2 Pills a Cathartic.
3 Pills a Purgative.

This is the Way Milburn's Laxa-Liver Pills Work.

You won't have the old, griping, nauseating, sickening, purgative pills once you try Laxa-Liver.

They do not knock out your system or deplete the vital organs.

They work gently and effectively, without a gripe or pain.

If you are troubled with constipation or biliousness, driven to distraction with sick headaches, if your tongue is coated, your breath bad, your complexion muddy, your eyes yellow, stir up your liver with a few doses of Milburn's Laxa-Liver Pills.

Mrs. Roy Mackie, Orillia, Ont, writes: "I desire to express my thanks for the relief I have had by using Milburn's Laxa-Liver Pills. I had been suffering, for some time, from constipation and bad headaches. I tried all sorts of cures which did me no good until I was advised to try your pills. I got great relief after taking only a few doses."

Price 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

JELLY MAKING

To-day I am going to say something about one phase of fruit-preserving—namely, jelly-making. Now, one very important thing is to gather the fruits at the right time, so as to get the proper amount of jelly substance, or pectin.

Acid fruits are most satisfactory for jelly-fruiting, and under this class we may include apples, quinces, crab apples, currants and grapes as being the best jelly-making fruits. But blackberries, raspberries and peaches may also be used, and if a third of rhubarb or apple juice is combined with any of these, the juice will jelly satisfactorily. Currant juice added to raspberry will form a jelly.

Fruit that is not quite ripe contains more pectin. This pectin is found largely in the skin and core of the fruit, which are most essential in jelly-making.

Fruit for jelly-making should be gathered on the morning of a bright sunny day, to ensure its finest flavor. Never gather after rain, as the fruits will have absorbed rain water and so there will not be so much pectin.

The small fruits should be washed quickly, so there will be no chance of them becoming water-logged.

Essentials for Jelly-Making

Pectin.—In under-ripe fruits this pectin is in a sugar called pectone, which is insoluble in water. As the fruit ripens this is changed to pectin, one of the gummy substances. As it becomes still more matured, the pectin is changed to pecticecoid, and then it will not be gelatined when cooking

Acida.—Some fruit juices will not jell when cooked, so that acid may have to be added. In this case, tartaric acid gives a favorable result.

Sugar.—When fruit juice is boiled to a jelly without sugar the jelly is tough. The fruits with less acid require less sugar. The proportion is from three-quarters of a pound or one pound of sugar to one pound or one pint of fruit juice.

The best sugar is the cheapest, for inferior sugar is wasted in skum. The use of too little sugar will make tough jelly, and too much will destroy the flavor and texture.

It is better not to boil sugar with the juice for the whole length of time, as the acid of the juice will tend to invert sugar.

Boil juice alone for half the time, ten, fifteen or twenty minutes, depending on thickness and quantity of juice. Put heated sugar into juice, stir until it dissolves, and then boil mixture till it jellies.

About one tablespoon of lemon juice to one quart of jelly added to fruit juice improve the flavor. It is best always to extract juice from fruits before adding any sugar.

The fruits have the juice pressed from them, with tre addition of as little water and heat as possible.

Draining the Juice

Drain in a bag suspended over a vessel for some hours or over night. Before putting pulp into bag press it through a sieve. The jelly bag should be made of flannel, pointed at the bottom, so the jelly will run out chiefly at one point. Do not squeeze the bag if you wish a clear jelly. After the clear juice has been obtained, the remainder may be pressed out to make a very excellent, but inferior, article of jelly or marmalade.

Use one pint of juice to one pound of sugar. Boil down before adding sugar. If adulterated with water it will require longer boiling than if juice is pure. Heat sugar and add to boiling juice. As it boils up, draw to side of range and skim carefully three different times. Boil until juice will adhere to spoon as a jelly, or until it jellies quickly when cooled in a saucer. Then pour into jelly tumblers which have been well sterilized and afterwards rinsed in cold water before using.

Fruits which will combine in a jelly are grape and apple and quince, grape and quince; raspberry and currant; raspberry and apple or rhubarb, and any of the above mentioned fruits.

Good jelly should not be cloudy. It should not be tough, but firm. It should quiver but not flow. If cut the angles should keep shape.

Sealing.

When the jelly is cold it should be well sealed to prevent mould. Alcohol is the best seal, as it prevents mould life. When cold, fit a circle of tissue paper, dip in brandy, and place directly on surface. Then cover top of glass. Olive oil may be used to cover surface of jelly and also paper for top of jar.

AMHERST SPECIALS

Note the Difference in These Two Boots.

It is very slight—in style and height of heel and in the toe—this reveals the subtle differences between the thirty-five to forty lines that this type of boot covers in our stocks.

Including high, low and medium heels; broad, medium and recede toes, soles of Leather or Neolin. Leathers include Patent, Vici Kid, Calf, Colored Calf and Side Leathers. Colors are in Tan, Mahogany, Grey and Black. Goodyear and McKay welts.

Complete stocks of all the above carried at Amherst and at our Halifax Branch at 164-166 Granville St.

SIMPLE SOUPS

They will do for cool nights or hot.

By Mrs. Emily Grant.

For the past few months we have been all more or less content to leave soups off our menus, but with the approach of cooler weather it once more takes its accustomed place.

While rich and heavy meat soups are not yet inviting nor wholesome, a delicate fish or vegetable soup will be found both appetizing for the cold nights and strengthening for the

The Tonic that Builds You Up

Don't think of OLIVEINE EMULSION solely as a medicine for Heavy Colds, and Deep-seated Coughs. It is more than this. It is the best tonic you can take to purify the blood, give you an appetite, improve the digestion, make flesh, and renew your vigor and vitality.

OLIVEINE EMULSION

The Great Health Restorer

is the ideal spring tonic for the whole family: for pale, thin children as well as for men and women who are tired, worn-out and all run-down.

Get a bottle of this splendid medicine and see how quickly you begin to pick up. Sold by Druggists and General Stores.

12

warmer ones that are still to be expected.

From among these light and seasonable soups, the following have been selected.

Potato Soup.

Wash, pare and cut three or four potatoes into small pieces and let them soak in cold water for twenty minutes. Then put into salted boiling water and cook until very soft. Meanwhile put one pint of milk on in a double boiler to scald, adding to it a teaspoonful of scraped onion and a stalk of celery.

When the potatoes are soft, strain and mash, pour the hot milk on them, season with salt and pepper. Rub through a strainer and put on to boil again. Put a teaspoonful of butter into a small saucepan and when melted add a scant teaspoonful of flour. Stir into the boiling soup. Cook five minutes, add a teaspoonful of fine chopped parsley and serve hot.

If too thick, more hot milk may be added. Serve with crackers or croutons.

Tomato Soup.

A delicious and nutritious soup is made in this way. Cook a quart can of tomatoes or its equivalent fresh, for twenty minutes, then rub through a sieve. Season with salt and pepper and a few drops of onion juice. Cook a quart of milk in a double boiler, adding when at the boiling point, two teaspoonfuls of flour stirred smooth in a little milk. Add two teaspoonfuls of butter.

Now beat the yolks of two or three eggs in a tureen, pour the milk into the tomatoes and this mixture into tureen over the eggs, beating vigorously or they will curdle. Sprinkle finely cut parsley over the top and serve very hot with croutons or bread sticks.

Onion Soup.

This is a broth wholesome and tasty. Fry two or three large onions in clarified dripping. When soft, add three teaspoonfuls of flour and stir until cooked and frothy. Now add slowly a pint of boiling water, stirring until smooth and slightly thickened. Have ready three potatoes boiled and mashed, and add to them a quart of milk that has been brought just to the scalding point.

Put the potato and onion mixture together, season with salt and pepper, let it get very hot, then press through a strainer into a cold tureen. Sprinkle over the top a little parsley minced fine and a handful of crisp croutons.

Corn Chowder.

For this one can utilize left over cooked ears of corn. Cut and scrape enough to make a quart of pulp. Peel five small potatoes and cut into small dice, and also dice a half pound of bacon. Put the bacon into a frying pan and cook until brown, adding a medium sized onion sliced fine, just before it is done. As soon as the onion becomes a delicate brown, remove the pan from the fire.

Put a layer of potatoes in a good sized stew pan, and sprinkle over it some of the friend onions and bacon. Next add a layer of the corn pulp and a seasoning of salt and pepper. Next comes another layer of the potatoes, bacon and onion, then corn, and so on until all the ingredients are in the pan, the top one being corn.

Pour in a cup and a half of water and place over the fire where it will cook gently for half an hour. Heat one pint of milk and thicken with two tablespoonfuls of flour blended with two tablespoonfuls of butter. Stir until smooth and creamy. Add this white sauce to the chowder with four crackers, broken pieces.

Stir all together, add a little butter or cream, and serve very hot.

Lobster Soup.

Pick out the meat of a small lobster and with a silver knife cut it in small pieces. Mix with three crackers, broken in pieces and rolled fine. Salt and speck of cayenne and two tablespoonfuls of butter. Add gradually a pint of scalding milk, stirring all the time. Boil up once and stir.

French Bouille.

An acceptable soup for the hot days is the French bouille, made of thickened milk. Put in a sauce pan two tablespoonfuls of corn, flour, a dessertspoonful of sugar, and a teaspoonful of salt. Mix to a smooth paste and add a quart of milk. Cook in a double boiler until thickened, then serve with crisp croutons and a dash of pepper. The hot milk will be found stimulating yet delicate, proving just the soup one requires for a hot day.

Potage a la Crecey

Scrape four large carrots and cut fine. Add two potatoes peeled and diced, two onions and two stalks of celery cut fine, and fry brown in good beef dripping. Then put into a sauce pan with a quart of boiling water, and cook until all the vegetables are tender. Press through a coarse sieve an dreturn to the fire with the addition of a tablespoonful of butter, a half teaspoonful of salt, two cloves, pepper and a tablespoonful of minced parsley. Have ready a pint of milk scalded and thickened, with a teaspoonful of corn starch, add to the soup and serve with croutons.

Creole Soup.

Slice one onion and fry brown in a little butter. Add one can of tomatoes, one carrot scraped and diced, a little minced parsley, a sprig of thyme and half a dozen cloves. Put in a kettle with two quarts of water and simmer slowly for two hours.

Cook two tablespoonfuls of rice and put it where it will remain hot. When the vegetables are tender run through a sieve, season to taste with salt and pepper, add rice, simmer ten minutes longer and serve.

Tomato and Macaroni Soup.

Break a cupful of egg macaroni into small pieces, cover with a quart of boiling, salted water, and simmer slowly for an hour. Add one cupful of stewed, strained and seasoned tomatoes, cook a moment, and just before serving add one cupful of cream or rich milk.

Calf, pig and sheep clubs are responsible for getting many a young lad interested in better stock. Have you a calf club in your vicinity? If not, why wait for anyone else to start it? Get busy.

Good Luck in your Baking

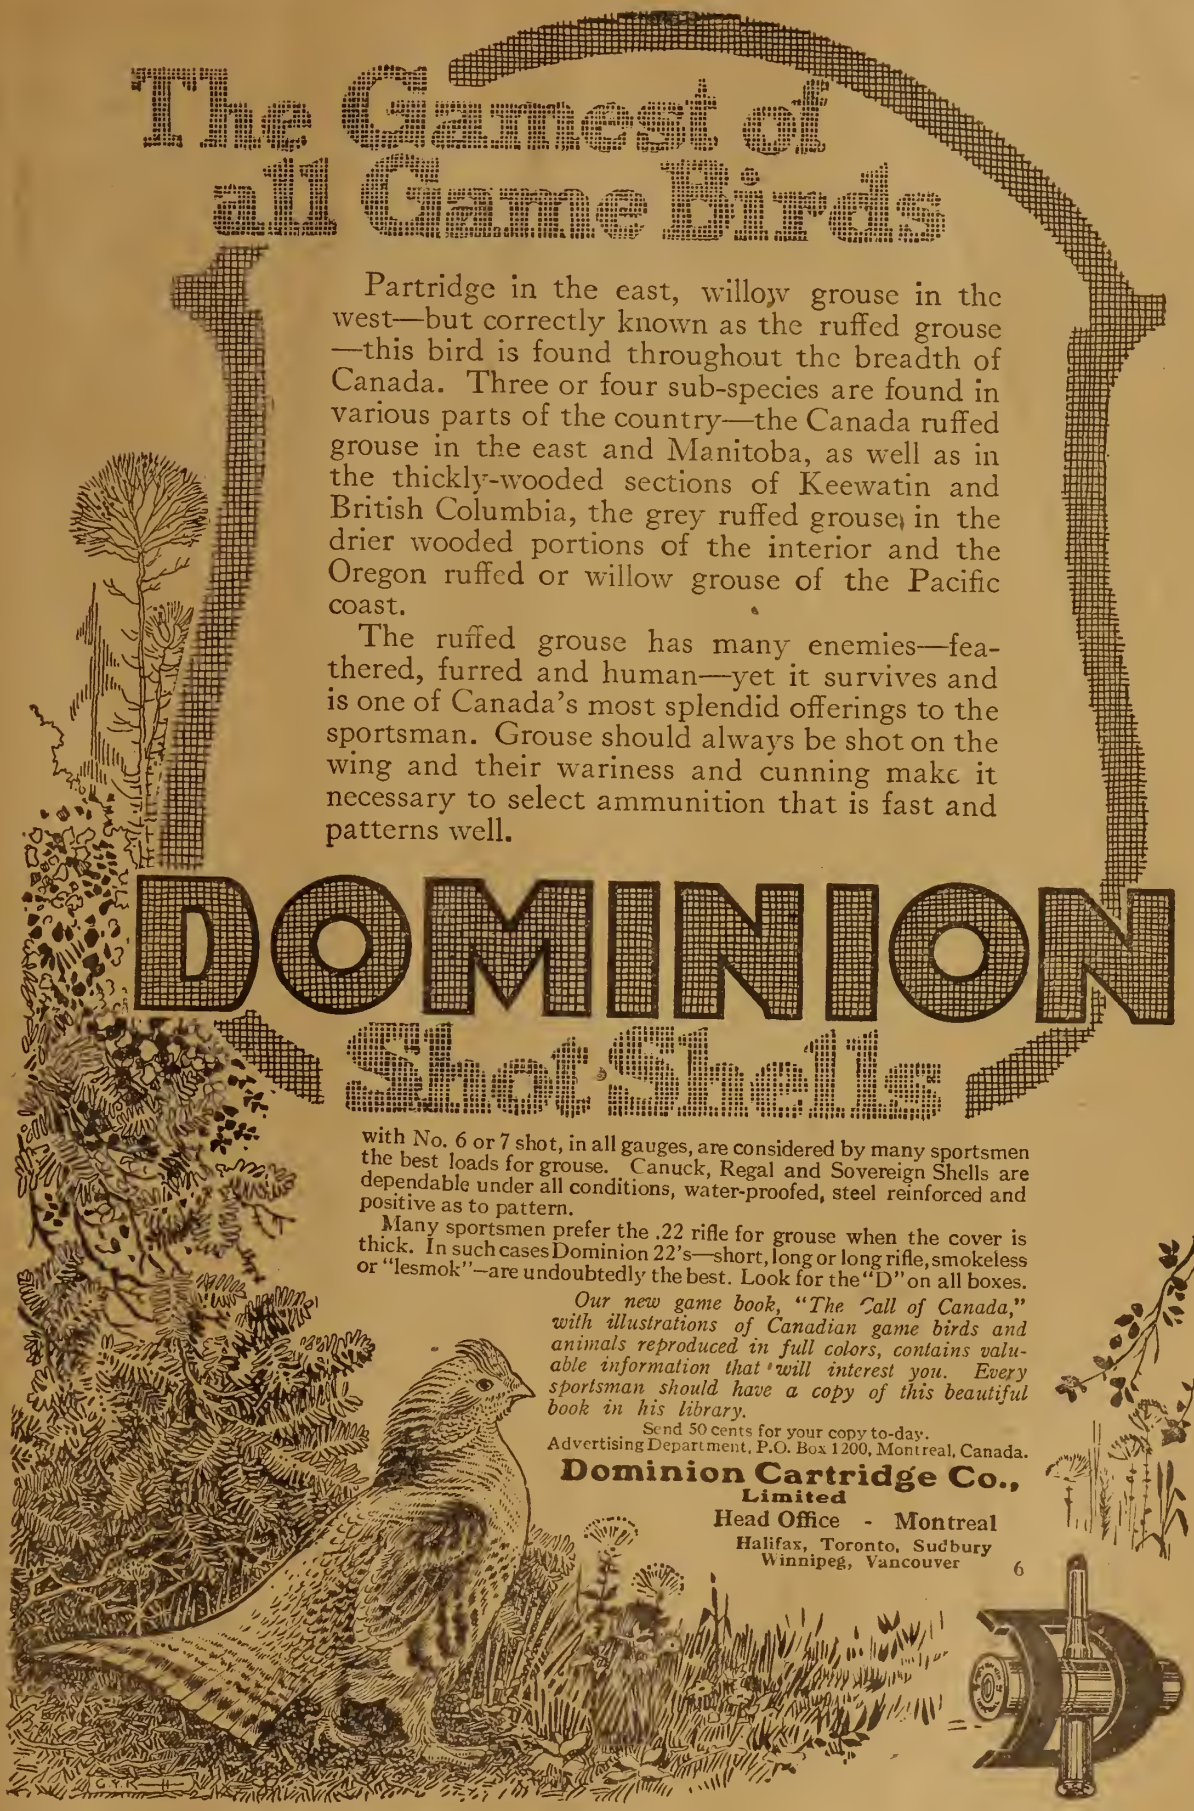
(Continued on page 894)



The Gamest of all Game Birds
Partridge in the east, willow grouse in the west—but correctly known as the ruffed grouse—this bird is found throughout the breadth of Canada. Three or four sub-species are found in various parts of the country—the Canada ruffed grouse in the east and Manitoba, as well as in the thickly-wooded sections of Keewatin and British Columbia, the grey ruffed grouse in the drier wooded portions of the interior and the Oregon ruffed or willow grouse of the Pacific coast.
The ruffed grouse has many enemies—feathered, furred and human—yet it survives and is one of Canada's most splendid offerings to the sportsman. Grouse should always be shot on the wing and their wariness and cunning make it necessary to select ammunition that is fast and patterns well.
DOMINION
Shot Shells
with No. 6 or 7 shot, in all gauges, are considered by many sportsmen the best loads for grouse. Canuck, Regal and Sovereign Shells are dependable under all conditions, water-proofed, steel reinforced and positive as to pattern.
Many sportsmen prefer the .22 rifle for grouse when the cover is thick. In such cases Dominion 22's—short, long or long rifle, smokeless or "lesmok"—are undoubtedly the best. Look for the "D" on all boxes.
Our new game book, "The Call of Canada," with illustrations of Canadian game birds and animals reproduced in full colors, contains valuable information that will interest you. Every sportsman should have a copy of this beautiful book in his library.

THE POTATO AND ITS CULTIVATION IN CANADA.

(Continued from page 868)

select at the same time for purity, trueness to type, improvement of shape of tuber, resistance to disease, and anything else which will improve the value of the crop.

SEED POTATOES.

In an article published in the April issue of a prominent agricultural journal, the use of small potatoes for seed purposes was advocated largely on the basis that the cost was considerably less for seed and a comparison between whole small potatoes and cut seed was made that seemed rather unfavorable to the cut seed.

Some western farmers use common small seed potatoes and in the interests of a modification of this practice with its attendant low yields the following material is presented:

The Oregon Experiment Station recommends that small seed as it is sorted out of fields of ordinary potatoes be not used for seed purposes. The reasons for this recommendation are:

1. Continued use of small seed either whole or cut usually results in about three years in the "running out of the seed."

2. Small potatoes in the average field are the result of:

(a) Diseases such as wilt, curly dwarf, Mosaic, chlorosis, rhizoctonia, blackleg, and some other troubles.

(b) Hills which have a natural tendency to produce a considerable number of small potatoes.

3. The use of such seed can not be conducive to good yields.

In the article referred it the writer pointed out that he chose hill selected stock, grew special seed lots, and kept the small seed from such lots. This is entitrely a permissible practice and about which there may be no material objection. Hill selected potatoes, grown in the special seed plots and especially if any diseased potatoes are rogued out as the season advances, are therefore all from superior hill and very different from the comomn run of potatoes in the average or ordinary field. It is the belief of the writer that each potato or cutting of potatoes from a good hill tends to reproduce the hill, and that there is little material difference whether a small potato from a good hill or whether a proper cutting from a larger potato of the same hill is made use of. The author of the article referred to found that he secured larger yields from using whole small seed from these selected hills than he did from cut seed.

The Oregon Experiment Station has ben trying various methods of cutting potatoes and we find that considerable difference in yield may result from cutting potatoes in various ways. We have found that the usual method of splitting potatoes lengthwise, either once or twice, has resulted in decreased yields of potaoes. We believe that the reason for this decreased yield is the destruction of the terminal sprout at the blossom or seed end of the potato, by the lengthwise splitting. In one trial an increase in yield of nearly ninety bushels an acre from land planted to blossom or seed end pieces weighing one and a half to two ounces, cut off, rather than split, was secured over similar potatoes on similar land and handled in a similar way, except that the blossom or seed end had been split, thus destroying in many instances the terminal sprout. We therefore believe that if cut seed potatoes are cut right, so that the blossom end is planted intact, and that a reasonably good number of eyes are left on other pieces of potato, that there will be no material difference in favor of the use of small whole potatoes. However, we recommend that small, while potatoes from hill selected stock be planted whole, unless they are three to four ounce potatoes, in which event they would be cut.

We further recommend that hill selected stock be planted on disease free land rather thickly so that the seed stock will not be too large. In other words, we desire to get a large yield of potatoes from hill seelcted stock, but prefer that these potatoes be small to medium in size and we believe this can be secured to best advantage by planting rather thickly on the seed production area. This small to medium seed stock may then be planted whole in the event of tubers that weigh two ounces or less or may be cut and each seed will then carry a large number of eyes in the event of pieces that weigh more.

Every potato grower recognizes that to cut large seed in a way that will carry a sufficient number of good strong eyes often means an unusually high expense for seed. Thick planting of hill selected stock on disease free land coupled up wtih the roguing out of diseased plants as they appear will produce the very finest quality and of a size that will get good results in the comemrcial field without using an unduly large amount of seed stock.

Whenever the upt-o-date poultryman finds a sick chicken in his flock he usually disposes of that individual promptly. In the event of a sick hog or a sick cow in the herd, the usual procedure is to isolate the animal and prevent any possibility of spread of infection to other members of the herd. The average potato grower upon seeing a sick, diseased, or inferior plant in the field lets it alone and harvests the small diseased potatoes from such a hill and in many cases either plants them or uses them for seed purposes, or sells them for seed. In the meantime he has allowed the disease to spread to other plants in the field. The best producers of the finest quality of seed will dig out such plants and either remove them enttirely from the field or burn them, that there may be no preventable spreading of the disease.

Pieces which carry the terminal sprout usually sprout more quickly and produce a larger number of plants per hill than will a piece of similar size from other parts of the potato which usually carry a smaller number of eyes.

We believe that this stronger and more vigorous terminal sprout, together with a larger number of plants that are produced per hill, account for the greater productiveness of such pieces, and that this terminal sprout on the small hill selected potato was resposnible for their vigor. We do not believe that the common run of small potatoes, even bearing in mind the fact that they carry the terminal sprout, are good seed stock, because terminal sprout advantage is overbalanced by inferior production habits and yield limitations on account of disease.

POULTRY ACCOUNTS

(Experimental Farms Note.)

Three dollars profit over cost of feed each year for every hen on the farm is a very good return, and according to monthly accounts received from farmers, by the Poultry Division of the Experimental Farm, Ottawa, there are a good many farmers' poultry flocks which are actually giving this profit every year, and some even better.

Poultry keeping on the farm is not merely a side line now, but is a sane business proposition, and the hit-and-miss methods that formerly obtained

in poultry work should no longer be tolerated. A national industry well on to the one hundred million dollars a year demands business methods, and in order to help the industry and to make it possible for the average poultryman to keep track of his poultry operations, the Poultry Division has put out a very simple form for poultry accounting, copies of which will be sent to any person making application and who will return to the Poultry Division each month a duplicate copy.

A Few Figures

For several years these poultry accounts have been supplied to persons asking for them and a compilation of the reports shows some very interesting data. For instance, of all the farms reporting their poultry operations 85.5% of them show a profit, and of this number the average receipt over expenditure for each hen per year is $2.04. As might be expected, a number of reports show a distinct loss each year and that is where one of the benefits of the account form comes in. Either the farmer himself or the Poultry Division at Ottawa can pick out the weak point or points and have them rectified.

Some other interesting figures are obtained from these reports. Among these are the figures that show that the average number of hens on the farms reporting is 52.9 the average expenditure per hen that is, for feed, appliances, etc. is $2.91 and the average profit over expenditure is $2.04. One farmer claims that he can attend to 100 hens while he is attending to one cow and his average return from 100 hens is $250.00.

A Manitoba Farm Poultry Account

Mr. Frank Harman, Boissevain, Man., has been sending in these accounts for some time and his inventory for the past year shows a very good profit on investment. He keeps an average of 150 White Leghorn hens and for the 12 months his expenses were—stock on hand $270. interest on capital invested $16.20, expenditure for feed and what appliances he purchased for the plant $292.37—or a gross expenditure of $578.57. His receipts were—sales—eggs, meat, and stock—$845.81, value of stock on hand at the end of the year $266.25, or a total receipt of $1112.06.

This leaves a balance over cost, without counting the labour, of $533.49 which works out at an average profit over expenditure per hen of $3.55. The average yield per hen was 132 eggs.

Good Prospects

The future looks brlght for the poultry industry, and the man who can keep poultry whether on the farm or in the back-yard, may look for remunerative returns if he uses business methods in his operations. Prices are good and though feed and labour may be high, one can take for granted that the higher the price of feed the higher the price of the product, and the labour question on a well organized poultry plant is not serious, for some one member of the family, even a boy or a girl, can often look after the poultry. The value of poultry products is being appreciated more each year. Last winter, when beef on a Canadian market was selling at from 10 to 12 cents for 1 lb. live weight, guaranteed new laid eggs were selling at 10 cents for two ounces or 80 cents a pound. It is about time that the Canadian hen was considered as a valuable asset.

If you want to make more money out of your poultry, write to the Poultry Division of the Experimental Farm, for free account forms. They will ask you to return each month a copy, but they will help you make your poultry pay.—W. T. Scott.

WINTERING BEES IN THE CELLAR VS. OUTSIDE

Whether to winter in the cellar or outside is a question that every beekeeper has to settle. Where the winter is long and steadily cold, the cellar is usually more satisfactory, but outside wintering succeeds in some moderately cold places if proper precautions are taken. At the Central Experimental Farm, Ottawa the two methods have been compared during the last five years. Wintering outside has been done in an apiary protected from wind by a board fence 8 feet high, the hives placed in cases made to hold four colonies each with packing material around the sides, beneath, and above the hives. The cellar was a low dry one, under the Administration Building, which was heated all winter. The results have been very close, but outside wintering has brought the colonies forward slightly in the spring.

In the wide belt where both cellar and outside wintering are about equally satisfactory, the deciding factor appears to be convenience. If the bee keeper has a well insulated and dry cellar, by using it he will save the expense of constructing wintering cases, and also a wind-break, if this is not present. For a few colonies in a cold reglon, a boarded-in part of the dwelling house basement makes a good cellar for the bees. and it is an advantage if the basement contains a furnace. Such a cellar should have a steady temperature somewhere between 42 degrees and 50 degrees F. In outside wintering, it is very important to protect the apiary from wind. Outside wintering has the advantage that the bees may be left without attention throughout the winter, whereas in many cellars in the milder parts of Canada, the ventilation has to be watched and controlled Outside wintering has been very successful at the Experimental Farm at Kentville, N.S., but at the Experimental Farm at Brandon, Man., the winter has been found too severe for the best results.

For successful wintering, more important than the method is early and careful preparation for winter. For example, one cannot expect cellar wintering to be successful if the bees are left outside until zero weather, or if they are brought out very early in the spring. Nor can one expect good results in outside wintering if packing is delayed until cold weather. Neither method will succeed if the colonies do not contain plenty of bees, especially young bees, and, above all, abundance of wholesome stores, preferably clover honey, or syrup made from white granulated sugar, stored in the combs before cold weather. Mice, if they get into the hives during the winter, will ruin the colonies in a very short while.—F. W. L. Sladen, Apiarist.

NOTICE TO CONTRACTORS

The New Brunswick Electric Power Commission.

Tenders will be received by the above named Commission up to noon, 21st day of September A. D. 1920, for the following work:

(1) The construction of an earth dam across the East Branch of the Musquash River including spillway intake, by-pass, etc., and the grading of a bed to carry a penstock from the damsite to the power house.

(2) The construction of an earth dam across the West Branch of the Musquash River including the items named above, together with the construction of a canal and the grading for the penstock from the damsite to the power house above mentioned.

(3) The construction of an earth dam across the Shogomoc River including items named above together with the construction of a canal and grading for the penstock from the damsite to the power house.

Sites one and two are situated about twelve miles from St. John and about one mile from the line of the New Brunswick Southern Railway.

Site three is situated about 40 miles north from Fredericton on the line of the St. John and Quebec Railway.

Plans, Profiles and Specifications can be seen and detailed information obtained at the office of the Commission, Canada Permanent Building, St. John.

A certified cheque for 5 per cent. of the estimated cost of the work must be attached to tenders.

The Commission does not bind itself to accept the lowest or any tender.

C. W. ROBINSON,
Chairman.
REID McMANUS,
Secretary.
C. O. FOSS,
Chief Engineer.

CHARLOTTETOWN EXHIBITION HAS BIG PROGRAM

The Charlottetown exhibition, which will be held from September 28th to Oct. 2nd, has a splendid program arranged for this year. The show is open to all of Canada. It has been held without a break, during the war, and this year will see a generous increase in the amount of prize money offered. In the live stock classes fourth and fifth prizes will be awarded, where the number of entries are sufficiently large to justify it

The Clydesdale Horse Association, the Shorthorn Breeders' Association, the Ayrshire Association and the Holstein Association, are all offering special prizes for their respective breeds.

The Canadian Bank of Commerce offer Silver Cups in several Classes of Live Stock.

The Exhibition which lasts four days will be full of instruction for exhibitors and visitors.

There will be five days' horse racing when the fastest horses in the Maritime Provinces and Eastern States are expected to race.

A visit to Charlottetown, the centre of the Garden of the Gulf in September is well worth making.

Come at the opening and remain till its close. It will be time well spent.

KEEPING DOWN THE COSTS OF PORK PRODUCTION

A test was undertaken by the Deleware Experiment Station to determine as accurately as possible the cost of a pig at weaning time when 60 days old. The experiment began on Nov. 1, 1917, and covered a period of 180 days, closing on April 29, 1918. Twelve Berkshire sows and one Yorkshire sow were mated to a Yorkshire boar. These sows had been running on clover pasture with a limited grain allowance previously to Nov. 1, and were not carrying much flesh. After Nov. 1 they were fed corn at the rate of 1½ per cent of the weight of the sows, wheat middlings and bran mixed in equal parts and supplied in a self-feeder, and tankage fed in another self-feeder. This ration was continued until December 15, or for a period of 45 days. At this date middlings were omitted as the sows were getting rather fat, and bran alone was fed with no other change in ration. On Jan. 1 the corn was reduced to about 1 per cent of the body weight of the sows. On Jan. 31 corn and cob meal was substituted for bran in the self-feeder, and this together with tankage self-fed was supplied to all sows until shortly before farrowing.

A few days before due to farrow each sow was removed to a community hoghouse and fed a thin slop of bran, middlings and tankage, with but little corn. As soon as each sow was on feed after farrowing she received all the thick slop, made of 30 parts middlings, 15 parts bran, and 5 parts tankage, that she could consume while suckling her litter for 60 days. In addition to the slop each sow received about 2 per cent of her body weight in ear corn during the suckling period and plenty of water. When her pigs

Duck Shooting is Coming

Are you ready for the rousing days when Duck Shooting opens? Keen eyes, steady hands, good judgment and a Remington UMC pump gun will bag the ducks as fast as they come.

Wetproof Shells are Sure

Remington UMC WETPROOF Shells are just what their name implies—proof against wet. Not alone the occasional shower, but the soaking rain, and the day-after damp of a wet climate. You can depend on the Remington UMC "Arrow" and "Nitro Club" shells to work smoothly through your shotgun every time—no matter what the weather.

Remington UMC of Canada, Limited
Windsor, Ontario

REMINGTON UMC

were weaned each sow was returned to the original lot and fed as before farrowing.

At the age of one month all the young pigs were given access to hominy feed and oil meal, each self-fed, and after weaning they received the same amount and kind of slop that their dams had when suckling them. All were given the simultaneous treatment for cholera at 60 days.

The sows made an average daily gain for the six months' period of 0.33 lb. They consumed on an average 2.8 lbs. of grain per 100 lbs. live weight during the six months. They consumed as low as 2 per cent of the body weight in grain daily, while at maximum milk production the consumption often was as high as 4 per cent of their body weight. It was found both economical and desirable to feed the sows to their maximum consumption while suckling the pigs for sixty days. The cost of gains in the pigs was greatly reduced through this system of feeding.

The average number of pigs farrowed per sow was 9.9; the average birth weight of pigs was 2.47 lbs.; the average weight per pig on April 29 was 29.57 lbs.; the average daily gain per pig was 0.46 lb. and the average number of pigs raised per sow farrowing was 6.6. The average amount of grain eaten daily per pig was 0.15 lb. and the grain required per 100 lbs. gain was 30.1 lbs. The cost of grain per 100 lbs. gain of pigs was 82 cents. When we consider the advantage in increased gains that may be secured by using a creep we are forced to admit that a very small amount of grain produced wonderful results in these pigs.

The interest on the investment was figured at 5 per cent for the six-month period. Charge for the simultaneous treatment was $2. A shelter charge of 25 cents per sow was made and a boar service fee of $1 per sow. The labour charge per sow was $3.75 and the estimated value of the manure $8. The average total expense per pig weighing 29.57 lbs. at 65.3 days old was $3.93. The feed prices used are those current at the time of working on the experiment, and they represent war-time prices.

The conclusions may be drawn from this experiment that the cost of producing a pig at weaning time depends upon two main factors: First, the average number of pigs raised per sow, and second, the feed cost of sows and pigs. By selecting prolific females and flushing them at breeding time the first cost item may be greatly reduced. By buying feeds in quantity, using forage crops, using a self-feeder, and feeding an entirely complete ration liberally the second cost can be kept down.—Hays, F. A., (Delaware Experiment Station), in The Breeders' Gazette, Vol. LXXV, No. 10, pp. 534-535. Chicago, March 6, 1919.

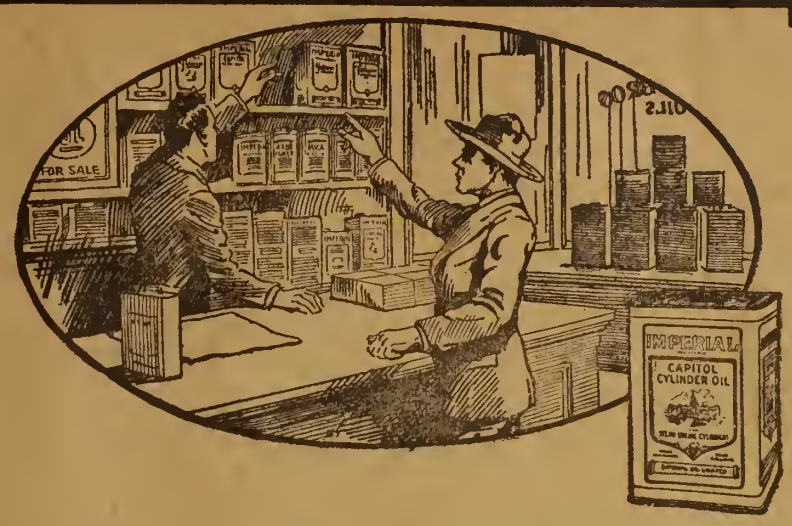
REVIVING OLD MEADOWS

To renovate old meadows, harvest the hay crop early. Just as soon as the field is clear, disc, harrow or cultivate the surface sufficient to break some of the sod surface so that seed sown will come in contact with the soil.

Sow a mixture of the following:—

Timothy	6 lbs.
Red Top	6lbs.
Alsike	6 lbs

When the seed has been sown, run a spike tooth harrow over the surface to cover the seed. Next apply a top dressing of barn yard manure at the rate of 12 tons per acre. This work should be done immediately after the seed is sown. The earlier the seed is sown the stronger the growth of plants will be to withstand the winter. Manure applied early will force the growth of the young plants, revive the parts of the old meadow that is unbroken and will be well incorporated in the soil before winter sets in. Low pasture lands can be revived in the same way and seeded early in August. —John Fixter, Supervisor of Illustration Stations.



"Yes That's the Imperial Lubricant for My Engine"

IMPERIAL Lubricants

For gasoline-burning engines—automobiles tractors, trucks.

IMPERIAL POLARINE AND IMPERIAL POLARINE HEAVY

For motors requiring an unusually heavy oil.

IMPERIAL POLARINE A

For kerosene-burning stationary engines and tractors.

IMPERIAL POLARINE KEROSENE TRACTOR OIL AND IMPERIAL POLARINE KEROSENE TRACTOR OIL, EXTRA HEAVY

For open bearings of separators, binders,etc.

IMPERIAL PRAIRIE HARVESTER OIL LIGHT

IMPERIAL PRAIRIE HARVESTER OIL HEAVY

For worn and loose bearings—a thick oil.

IMPERIAL ELDORADO CASTOR MACHINE OIL

For steam cylinder lubrication—tractors and stationary engines.

IMPERIAL CAPITOL CYLINDER OIL

For stationary and portable engines using either kerosene or gasoline.

IMPERIAL STANDARD GAS ENGINE OIL

For grease cup lubrication—a clean solidified oil.

IMPERIAL ARCTIC CUP GREASE

Made in different consistencies.

Imperial Farm Lubricants are sold in 1 and 4 gallon sealed cans, half-barrels and barrels.

FIND the Imperial Lubricant for your engine—automobile, tractor, stationary—and you will get more and better work from your machinery—at less cost for oils and fuels.

Each Imperial Lubricant represents exhaustive experiments and tests, both laboratory and under searching service conditions. The results of these tests, for automobile and tractor lubrication, are summed up in the Imperial Charts of Recommendations which are displayed wherever Imperial Lubricants are sold.

Follow these recommendations and you will get maximum power and economy from your fuels, with least wear and tear on engaging parts—minimum repair and replacement expense.

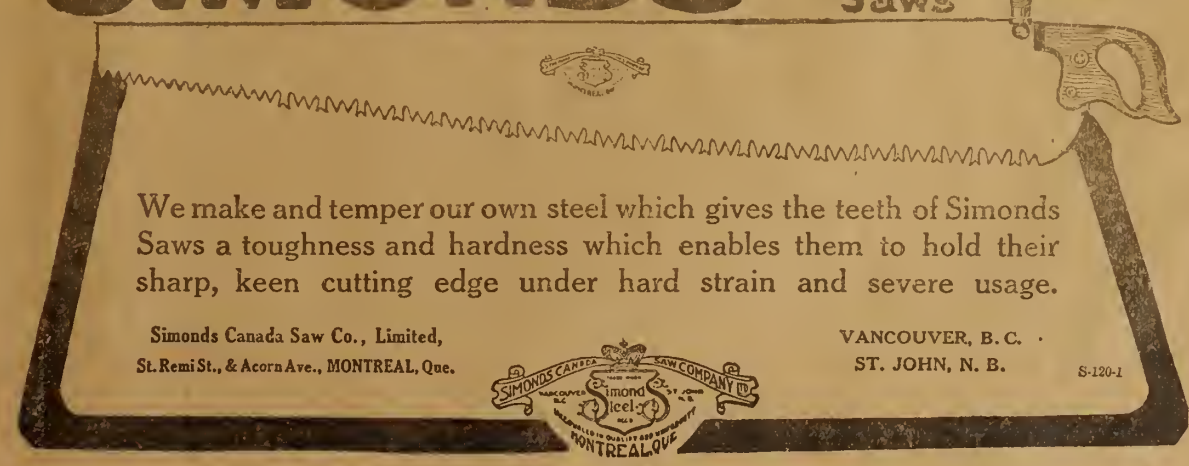
For additional information on farm machinery lubrication problems consult the Imperial Oil Man; or write our nearest branch.

IMPERIAL OIL LIMITED
Power Heat Light Lubrication
Branches in all Cities

HOW MUCH GRAIN TO FEED

Specialists of the United States Department of Agriculture advise poultry keepers to feed about 1 quart of scratch grain and an equal weight of mash (about 1½ quarts) daily to 13 hens of the general purpose breeds, such as the Plymouth Rocks, Rhode Island Reds or Wyandottes, or about 16 hens of the smaller or egg breeds. This would be about 7½ pounds each of scratch grains and of mash daily to 100 Leghorns, and about 9½ pounds of each to 100 general purpose fowls. If hens have free range or large yards containing green feed, a general purpose hen will eat about 75 pounds of feed in a year, while a Leghorn will consume about 55 pounds in addition to the green stuff which she eats.

SIMONDS ONE MAN Cross Cut Saws No. 111



We make and temper our own steel which gives the teeth of Simonds Saws a toughness and hardness which enables them to hold their sharp, keen cutting edge under hard strain and severe usage.

ST. JOHN, N. B.

S-120-1

THE CITY MILK SUPPLY

(Continued from page 873)

or acting under control from the seat of government. The Vancouver authorities are endeavoring to recognize only one class of milk. They consider this essential because no matter from which dairy the milk is obtained, they must be confident that the milk is pure, clean, obtained from disease-free herds, supplied in sterilized bottles capped by machinery. They also consider that if people want milk other than the one standard it is for the consumer to manipulate it as they require. The authorities act on the principle that if a person likes his food, such as meat, in a state of highness, it is not for the butcher to keep it until it is ripe, but for the purchaser; if also milk is preferred sour, or inoculated, it is the consumer or householder who should bring about the conditions required. At one time approved milk was on the Vancouver market, but owing to its higher price it was used only by the people who could afford to pay, and those who should have benefited could not do so, owing to the higher cost.

No certified milk is sold in Vancouver, because the requirements for certified milk production in British Columbia are prohibitory from the standpoint of cost, and the inability to obtain the right kind of farm help. Ninety per cent of the milk is pasteurized, although this is not compulsory. The method is as follows: The milk passed through a strainer into the receiving vat, then thorugh the clarifier and the pasteurizer, where it is raised to a temperature of 142 to 145 degrees F. It is held at this temperature while passing through the holder for thirty minutes, and then goes to the water cooler. From here it passes to the brine cooler, and to the filler, from which the full bottles pass to the machine capper. It is finally put into the cold room ready for delivery.

Vancouver has both chemical and baeterial laboratories municipally owned. It is estimated that .065 gallons per day per capita is consumed as milk (this does not include cream or its equivalent as milk). This estimate has been found very nearly correct by divison of the milk as put out by the total population.

It is required that evidence be produced to the proper department of the city that herds supplying the city with milk have been tested within the past twelve months. The provincial government have veterinary inspectors travelling the farm districts and testing cattle. Those animals giving positive reactions are condemned, while the herds that pass the test receive from the provincial inspector a certificate showing that the cattle have been tested and are free from disease; also showing in what class they are placed. There are three classes, A., B., and C.

The milk producers in British Columbia do not require a license to ship milk into the city, but producers wishing to sell milk in the city must first take out a license which, however, is not granted until the farm premises are inspected by the city inspector, who satisfies himself as to the adequacy of the equipment provided and is assured that in all respects the city by-law is complied with. The authorities of Vancouver are of the opinion that to license producers supplying milk to municipalities is beneficial, providing that such licensing is only nominal and not for revenue-producing purposes.

The radius in which milk is gathered into the diflerent cities varies considerably, but throughout Canada, except in the case of the larger cities, where the maximum radius is about one hundred miles, the milk is gathered only for a distance of from ten to twenty-five miles, depending on the means of transportation.

CANADIAN SHOES FOR CANADIAN PEOPLE

22,000 Canadian Men and Women ask you to buy "Made-in-Canada" Shoes

22,000 CANADIANS are engaged exclusively in the manufacture of Boots and Shoes.

The industry provides them with over $20,000,000 a year to spend within the Dominion.

They buy food and clothing; pay rent and taxes—they help swell the total of Canadian trade.

ALLIED with these 22,000 men and women are many thousands of other workers who contribute to the making of Boots and Shoes. These include textile operatives; wire, nail and metal workers; machine manufacturers; box and carton makers; coal miners and dealers; railway men and shippers; printers; packers and battalions of clerks.

All these, and more, participate in the 50 million dollars which is the yearly value of the Canadian-Made Shoes.

EVERY pair of Canadian-made Shoes you buy actually puts money in the pay envelope of this vast army of men and women.

Every pair of imported Shoes you buy reduces Canada's capital stock and puts money in the pockets of foreigners who contribute nothing to our national growth

CANADIAN - made Shoes, grade for grade, are the equal of the best in the world.

The most scientific processes of manufacture are employed.

Canadian workmen are as conscientious and skilled as those of any other country.

SITUATED as we are between the Old World and the New, every authoritative idea of shape and style and fashion is immediately seized and developed.

The price of Canadian - made Shoes is based entirely on actual production costs. It represents 100% of value.

¶ *Canada produces footwear of every desirable type, and of standard quality in all grades. When you buy Made in Canada Footwear you are assured, at fair prices always, of the utmost that modern skill can produce in Comfort, Service and Style.*

3

SHOE MANUFACTURERS ASSOCIATION OF CANADA

STORING ROOTS AND POTATOES.

The two methods most used for the storing of roots and potatoes are the pit and the root house. The pit method is excellent but has the disadvantage of not being easily accessible during very cold weather. To make a pit dig a trench four feet wide and two feet deep and pile the crop in level with the sides and heap towards the centre, not having any roots higher than three and a half feet at the centre. Before putting in the crop, nail two twelve-inch boards together forming a V-shaped centilator the full length of the pit and allow them to protrude each end, rest the ventilators on the two boards, a hole being cut in the boards to allow ventilation to come from below. The ventilator shafts are made from 8 in. boards, two sides not boarded up inside the pit but slatted to allow free air passage and at the same time prevent roots from getting into the shaft. When all is in place cover with straw and put on just enough soil to prevent the straw from blowing away, then allow the roots to cool off for a few days. Then add five inches of soil leaving all vents open both at the top and at the ends. As the weather gets colder add more dirt and in very cold weather close the vents by stuffing old sacks or similar material into them. When the weathem modifies remove the sacking.

In root houses similar precautions must be taken. Give the house as much air as possible when the roots are first stored and see that the atmosphere is not too dry. In our dry climate we sprinkle the floor well once in three weeks. Should there be the least sign of shrivelling, more water should be put on the floor. Vegetables that have already gone down a little can be brought back by increasing the moisture in the air. During wram spells close the door during the day leaving it open in the evening till bed time to cool the air. The temperature in a root cellar or pit should not go above 38 deg. Fahrenheit nor below 32 deg. The moisture content of the air can be taken by a hygrometer.

During long spells of cold weather we watch the thermometers very closely and if any danger is feared we use oil burners in the cella at night. The exposed walls of a root cellar need air spaces if made of stone or cement. When only a small portion of the cellar is out of the ground, bank well wit hmanure and this will

keep the frost from penetrating the walls.

Allow the roots or potatoes to harden and dry in the field covering them with tops if the weather is cold.

Handle carefully; bruised and damaged products should be kept apart tb be used up first.

Don't pile up the crop too high. We make our bins three feet high with a false bottom over the lower bin, and then fill another three feet. This allows free circulation of the air and can be cooled off very quickly.

Let the air in freely from doors and ventilators and keep the holes in the roof for filling the root hous open till danger o heavy frost is near.

Watch the humidity of the house and keep the floor well sprinkled to avoid shrivelling.

Do not allow the temperature to go higher than 38 deg., nor lower than 32 deg.—R. H. Helmer, Superintendent, Experimental Station, Summerland, British Columbia.

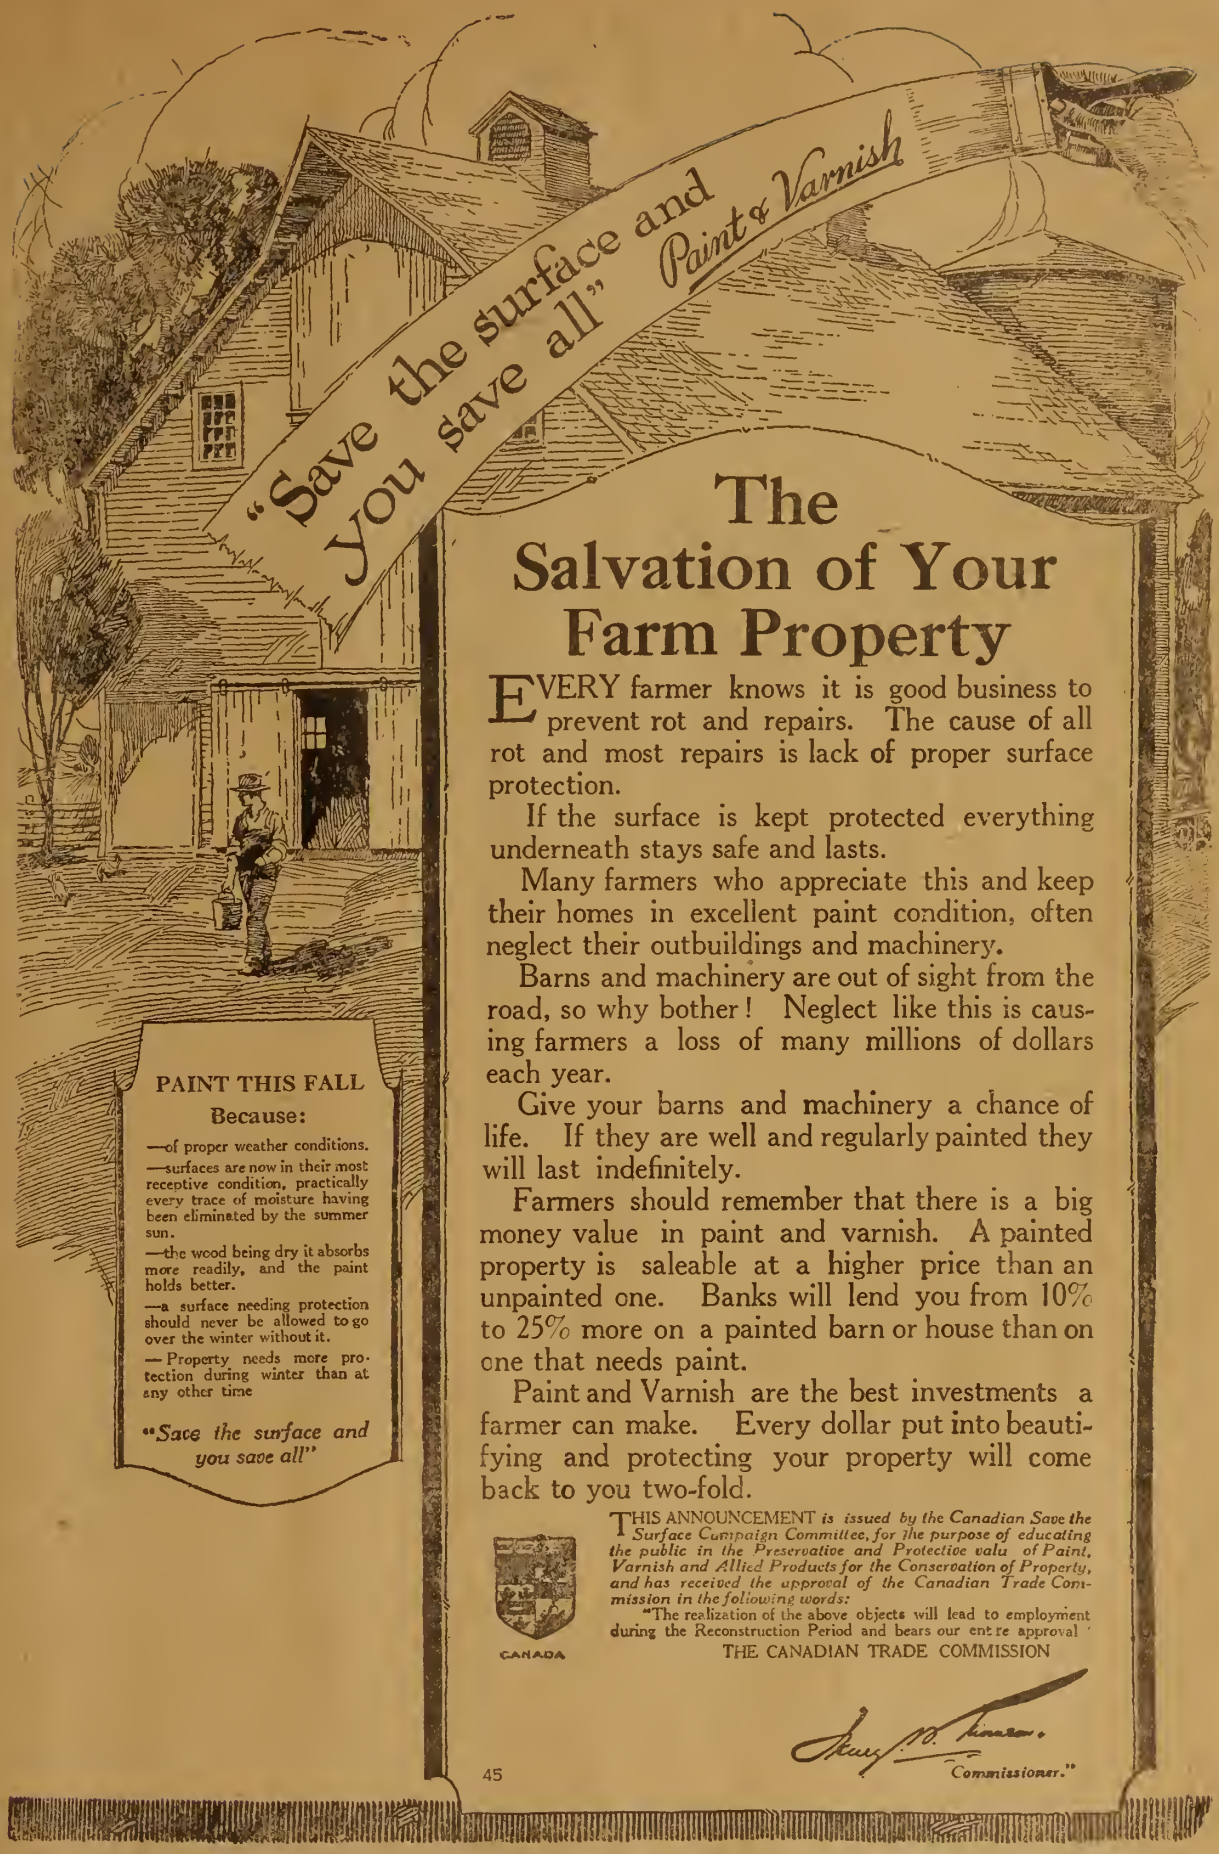
THE VALUE OF ADVERTISING OF AND FOR LIVE STOCK

To the well known, established, breeders of live stock any advice on the value of advertising is superfluous for in the large majority of cases it has been by proper advertising of high class goods that they have built up their business. The purpose of this article is to call the attention of the smaller breeders, the beginners in the business, to the possibilities in advertising any live stock which they may have for sale. For example every year at the Central Experimental Farm, Ottawa, there is a deluge of enquiries as to the possibility of purchasing young animals of the various classes of live stock. Needless to say the Farm is unable to fill all the wants for obvious reasons such as being sold out of the particular class of stock wanted; not having animals of the age or sex wanted; and not keeping representatives of the breed wanted. In an endeavor to assist our correspondents to locate the animals they wished to purchase it has often been found and sometimes too late that breeders right in their own viciniity had animals of the class of stock wanted for sale, but as they had not been advertised for sale nor had the intending purchaser advertised his wants, both parties missed a chance to do business which would have benefited both.

From the above it would seem that a more extended scheme of advertising on the part of breeders who are either in need of or wish to dispose of stock would be profitable for all parties concerned. This advertising need not be very expensive. A small notice in the proper column of the local paper or in one of the farm papers which is popular in the district would serve the desired purpose quite adequately. If the number and quality of the animals warrant it, a larger advertisement with an illustration would be in order.

Advertising is of course, of particular value in disposing of breeding stock or animals not in fit condition for sale on the regular market. The writer has in mind one particular class of stock namely, aged pure bred dairy bulls of good quality and known to be breeding good stock. Many of these find their way to the butchers every year when it would be much to the advantage of the breed as well as to the farmers disposing of them and lucky enough to get them, if they were kept for further years of service A little timely advertising would in many cases accomplish this end.

Lastly advertising must be more or less seasonable, The greatest demand for dairy cattle and swine breeding stock is usually in the late winter and early spring, while sheep are more in demand in late summer and fall. Plan the advertising to meet the seasonal requirements and it can then be done most economically.—Geo. W. Muir, Animal Husbandman.



"Save the surface and you save all"
Paint & Varnish
PAINT THIS FALL
Because:
—of proper weather conditions.
—surfaces are now in their most receptive condition, practically every trace of moisture having been eliminated by the summer sun.
—the wood being dry it absorbs more readily, and the paint holds better.
—a surface needing protection should never be allowed to go over the winter without it.
—Property needs more protection during winter than at any other time
"Save the surface and you save all"
The Salvation of Your Farm Property
EVERY farmer knows it is good business to prevent rot and repairs. The cause of all rot and most repairs is lack of proper surface protection.
If the surface is kept protected everything underneath stays safe and lasts.
Many farmers who appreciate this and keep their homes in excellent paint condition, often neglect their outbuildings and machinery.
Barns and machinery are out of sight from the road, so why bother! Neglect like this is causing farmers a loss of many millions of dollars each year.
Give your barns and machinery a chance of life. If they are well and regularly painted they will last indefinitely.
Farmers should remember that there is a big money value in paint and varnish. A painted property is saleable at a higher price than an unpainted one. Banks will lend you from 10% to 25% more on a painted barn or house than on one that needs paint.
Paint and Varnish are the best investments a farmer can make. Every dollar put into beautifying and protecting your property will come back to you two-fold.
THIS ANNOUNCEMENT is issued by the Canadian Save the Surface Campaign Committee, for the purpose of educating the public in the Preservative and Protective valu of Paint, Varnish and Allied Products for the Conservation of Property, and has received the approval of the Canadian Trade Commission in the following words:
"The realization of the above objects will lead to employment during the Reconstruction Period and bears our entire approval"
THE CANADIAN TRADE COMMISSION
CANADA
Commissioner."

VISIT OF CANADIAN FRUIT TRADE COMMISSIONER TO BRITAIN.

(By C. W. BAXTER, Commissioner)

Mr. J. Forsyth Smith, Canadian Fruit Trade Commissioner in Great Britain, who, since 1915, has devoted most of his time to promoting the interest of Canada's fruit industry in Great Britain, is now visiting the apple-growing sections of Canada. During the period when apples were not permitted to enter Great Britain, Mr. Smith acted as general trade Commissioner, and through the courtesy of the Department of Trade and Commerce in which he is employed, he has co-operated with the Fruit Branch of te Department of Agriculture.

Mr. Smith attends all apple sales in the Old Country during the shipping season and cables to the Fruit Branch prices and items of general niterest to Canadians shipping fruit across the sea. This intelligence is published in the Fruit Branch Telegraphic Market Reports which are issued simultaneously to yrowers and dealers twice weekly from Middleton, N. S.. Ottawa, Ont., Winnipeg, Man., and Vancouver, B. C., during the season when the movement of fruit is heavy, and once each week, from Ottawa only, during the balance of the season. In addition to the information from the British markets, these reports contain wholesale prices quoted at all alrge marketing centres in Canada.

Mr. Smith has acquired a thorough knowledge of trade conditions abroad. This is of great value to Canadian exporters, and before leaving for Canada, he visited Europe in order to learn conditions there and to ascertain the possibilities of extending the market for Canadian apples.

Arrangements are being made for the holding of meetings in the various apple-growing provinces in order that people interested in the export market may have an opportunity of obtaining first hand information from Mr. Smith. The dates and places of meetings will be announced through the agricultural press serving the localities in which the addresses will be given.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

WE OFFER IN JERSEYS:—

A few mature cows, several heifers and a couple young bulls of serviceable age.

In Shorthorns:—2 cows, 2 heifers and 2 young bulls of special promise.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word each insertion. MARITIME FARMER, Sussex N. B.

500 CHEVIOT SHEEP FOR SALE

Consisting of 300 Breeding Ewes and 200 Lambs.

This flock located on the south shore N. S, has been bred up from native shore ewes and pure bred Cheviot rams until most of them now have only a sixteenth of blood not Cheviot. They pasture in the open, unhoused, upon the abundant feed of the headland ranges and barrens, summer and winter, requiring help in the way of rough hay only and that only on rare occasions when deep snow remains on the ground for any length of time. Among them are many exceptionally fine hardy breeding ewes and from the lambs of this year excellent service rams can be selected. The purchaser by arrangement can have until January 1st, 1922, to remove them with free use meanwhile of the ranges, houses and necessary equipment. If purchased for slaughter, beginning with yearlings now ready for market, the whole flock will be in condition upon pasturage alone to market before next January, except a few backward lambs which either will do for feeders to be disposed of during the winter or may be left over to market next year.

For further particulars and inspection inquire of

Why Canada Needs a Protective Tariff

Summary of Statement submitted to the Committee of Cabinet Ministers at Winnipeg, on September 14th, by the Canadian Manufacturers' Associatiou.

ACCORDING to the Dominion Census, about 700,000 people are employed in the factories of Canada. Including their families, the number of persons who depend for their living on the wage rolls of Canadian factories number 2,000,000. In addition there are probably half as many more wholesale and retail traders, professional and business men and others who derive the chief part of their incomes indirectly from industrial establishments. Moreover, as about 80 per cent. of the total annual produce of Canadian farms is consumed in Canada, chiefly by the people living in towns and cities, farmers are also vitally concerned with industrial conditions.

Any civilized country that aspires to greatness must be strong in the following departments of national activitiy; agriculture, manufacturing, transportation and finance. Purely agrarian countries have never reached any degree of greatness; purely industrial countries cannot exist; both manufacturing and agriculture are helpless without the machinery of finance and transportation systems to carry produce.

What part does the factory play? Remove the factories and imagine the effect on the wholesale and retail trade, on the banks, on the financial and brokerage houses, on real estate, on the professional men, on the tax-collecting departments? In the majority of Canadian cities and towns the factories are the direct or indirect cause of a very considerable part of business transacted; because the welfare of many allied activities depends on the ebb and flow of the factory output, the buying capacity of the factory purchasing department and the spending of the factory payroll. Strike at the factory and you strike at nearly every one in the city or town. Strike at the city or town and you strike at the agricultural population surrounding the city or town, for cities and towns use the produce of the farms, while the cities and towns in their turn supply the farms with most of those luxuries, comforts and necessities which are part of civilized existence.

Nearly every family in Canada, directly or indirectly, is benefited by industrial prosperity and injured by industrial depression.

The Principal of Protection.

As the Canadian Customs Tariff has not been revised since 1907, revision is now overdue. After careful investigation, it may be found that the rates of duty on some articles are too high and will consequently be lowered; or, in certain other cases, that the rates of duty are too low and will consequently be raised; or, in other cases, that the rates of duty will be considered fair and remain unchanged. But all tariff revisions are governed by a guiding principle, and this principle must be either the policy of protection or the policy of free trade. The term "tariff for revenue" is misleading because a tariff of even 10 per cent. on an article produced in Canada yields revenue and also affords a small degree of incidental protection.

In presenting this statement, therefore, the Canadian Manufacturers' Association respectfully begs to reaffirm its advocacy and support of the policy of adequate protection for Canadian industry (the policy which has been maintained since 1878 in Canada by all political parties that have held power).

Moveover, the Association pledges its support to any measure which will hasten the adoption throughout the British Empire of substantial customs preferences for Empire products, corresponding to the preferences now provided in the Customs tariff in Canada.

Definition of Protection.

The objects of the protective system in Canada have been and should continue to be,—

(1) To diminish, as far as possible, the importation of goods from foreign countries which can be produced at home.

(2) To facilitate the importation of raw materials for manufacturing processes, which cannot be produced at home.

(3) To encourage the exportation of Canadian goods as finished products.

(4) To make Canada self-contained by developing and encouraging within her boundaries all legitimate activities that will give occupation to Canadian citizens.

The protective system is, above all things, a national system. The country is the unit. It aims to make the individual country strong in all vital departments of activity. If it were founded on any other basis it could not survive, and the only reason that the protective system has been in operation in practically all civilized countries for several centuries, with a few intermittent exceptions, is that the system safeguards and develops the resources and prosperity of the great majority of the citizens of each country.

* A copy of the full statement may be had on application to any office of the Canadian Manufacturers' Association.

A FEW REASONS

Why Canada should retain the present fiscal policy of adequate protection for Canadian agriculture, industry, labor and business.

1. Canada has shown wonderful growth in agriculture, manufacturing, forest protection, mineral production, transportation, banking, insurance, and other business since the adoption in 1878 of the National Policy of adequate protection for all classes.

2. Because Canada was strong in all departments of national activity, she made a great record in the war.

3. Since the war practically all civilized countries have retained or increased their protective tariffs.

4. Over 2,000,000 Canadians are supported by wages paid by Canadian factories.

5. Over 80 per cent. of all the produce of Canadian firms is consumed in Canada.

6. The tariff has caused over 600 branches of United States factories to locate in Canada.

7. The tariff provides a great portion of the revenue of the Dominion Government.

8. The present tariff of Canada is very moderate; tne average rate of duty on all dutiable importations is 22½ per cent.; the average rate of duty on all importations, free and dutiable, is only 14 2-3 per cent.

9. Canadian products should not be exported in the raw state but should be manufactured in Canada in order to create business, provide employment and add to the national wealth.

10. Canada has maintained a protective tariff for 42 years. The United States, our greatest competitor, has maintained a protective tariff for 131 years. Their manufacturers have a home market of 105 million people. Our manufacturers have a home market of about 8 million people. Last year each inhabitant of the United States bought, on the average, $4.41 worth of Canadian goods, while each Canadian, on the average, bought $100.26 worth of United States goods. United States purchases from Canada were largely raw material. Canadian purchases from the United States were largely manufactured goods. Is it surprising that the rate of exchange is against Canada and that our dollar is at a heavy discount in the United States? This is the situation with a Canadian tariff. What would it be if the tariff were removed? Remove the tariff, and in the words of ex-President Taft, Canada will become "an adjunct of the United States."

11. The destiny of Canada is a fully developed nation within the British Empire.

The Tariff.

The tariff protects domestic industry by increasing the difficulty of importing competing products; in the second place, it secures revenue for the Government; and in the third place, it can be used either as a weapon against any foreign country that is using discriminatory methods, or to bargain with a foreign country for tariff concessions that will open desirable markets for Canadian products. Consequently, the tariff, being the chief instrument which maintains the protective system in operation, cannot be suddenly changed or abolished without at the same time changing or abolishing the protective system.

Support of the protective principle should not be confused with advocacy of a high tariff. The Canadian Manufacturers' Association has never advocated a high tariff; and does not advocate a high tariff now; but it is a conservative statement of fact to say that the Canadian customs tariff as it stands today is not a high tariff and that in comparison with tariffs of other countries it is very moderate.

During the year ending March 31st, 1920, the average rate of duty on all dutiable importations, less the customs war tariff collections, was 22½ per cent.

The average rate of duty on all importations, free and dutiable, after deducting the customs war tariff collections, was 14 2-3 per cent.

On the 18th day of May, 1920, the customs war tariff rates were completely removed by Parliament. Surely it is reasonable to say that the average rate of duty of 22½ per cent. on all dutiable importations and the average rate of duty of 14 2-3 per cent. on all importations, dutiable and free, now imposed by the Canadian Customs Tariff, constitute a moderate tariff.

The World Tendency Towards Protection.

Fiscal policies of countries are inter-related and swing together like a pendulum towards protection at one period and towards free trade at another period. This fact is significant because the present swing of the world pendulum is strongly towards protection.

Following the armistice, industrial countries, especially those that had been engaged in the war, took precautions to safeguard their home markets against a deluge of foreign goods, in order that their demobilized soldiers and war workers could secure employment in their own countries. The United Kingdom, notwithstanding statements to the contrary, is not a free trade country. She now applies various protective duties, and has a measure before Parliament designed to prevent dumping, arising from exchange depreciation or other causes. During his budget speech in the House of Commons on April 19th last, the Honorable Austen Chamberlain, Chancellor of the Exchequer, stated that the United Kingdom had raised during the year ending March 31st, 1920, the sum of £149,360,000 from customs duties imposed on goods imported into the United Kingdom That is, every resident of the United Kingdom paid a customs tariff on the average of about $16 last year. In Canada last year the average per capita tariff tax, including the war tariff, now removed, was about $23, or without the war tariff, about $19.50. Yet, some people describe Great Britain as a free trade country and Canada as a high tariff country.

The business men of Great Britain realized early in the war that steps must be taken upon the cessation of hostilities to protect British industries and various committees have reported to the British Parliament recommending a measure of protection for British industries.

France increased her tariff rates during the past year, on most goods, by amounts varying from ten to three hundred per cent.; and as late as April 28th, 1920, she announced a new and extensive list of prohibited imports. Italy, Switzerland, Austria, Spain, Roumania and the Balkan States have made general increases in their tariffs. Recent despatches show that still higher protection is being provided in most of these countries, and especially in France, Italy and Spain. Japan has now in operation a high protective tariff.

In South America, all countries have tariffs designed not only for the purpose of producing revenue, but also to provide for a reasonable measure of protection for home industry. The average rate of duty on all importations, both free and dutiable, for these countries, for 1913, the latest year for which statistics are obtainable, follow:—

Countries.	Average ad valorem duty on Imports per cent.
Argentina	20.8
Brazil	35.9
Bolivia	17.1
Chile	19.9
Ecuador	36.6
Paraguay	31.1
Peru	21.9
Uruguay (1912)	36.2
Venezuela	46.7

The following clause was adopted by the National Republican Convention of the Republican Party of the United States, at Chicago, June 10th, 1920:—

"The uncertain and unsettled conditions of international balances, the abnormal economic and

trade situation of the world, and the impossibility of forecasting accurately even the near future, preclude the formulation of a definite programme to meet conditions a year hence. But the Republican party reaffirms its belief in the protective principle and pledges itself to a revision of the tariff as soon as conditions shall make is necessary for the preservation of the home market for American labor, agriculture and industry."

A tariff was introduced in Australia on March 24th, 1920, which is highly protective in character. All British countries outside the United Kingdom, have tariffs that are protective in character, with the exception of certain Eastern countries, such as India and the Straits Settlements, which impose duties on certain imports for revenue.

Official records show that there is not in the world today one country making any pretensions to industrial development that is without a protective tariff.

This Dominion's tariff legislation, designed for national development, must be affected by the fact that every great industrial nation today throughout the world has erected protestive tariff barriers against the exploitation of its markets by other nations. Were our customs tariff removed whilst other countries maintain and strengthen theirs, our markets would be filled with the overflow goods from protected foreign countries, while our goods would be largely shut out of foreign markets. This would so reduce the markets of our factories as to raise Canadian productive costs above a competitive basis; and many of them would be compelled to cease operations.

Growth of Canada Under Protection.

The best way to determine whether or not Canada has flourished under the policy of adequate protection for Canadian industry is to study the statistics, not for one industry, but for all the great basic industries, and see how they have developed since 1878. Consider first the total trade of Canada. The following table shows that since the introduction of the National Policy, our total trade has multiplied by sixteen times:

Fiscal Year.	Total Trade.
1879	$149,489,188
1920	2,351,174,886

Agricultural production in Canada has flourished as the following statistics indicate:—

Year	Field Crops	Other Farm Produce	Total Production
1900	$194,953,420	$169,953,446	$364,906,866
1919	1,452,437,000	523,404,000	1,975,841,000

The national output of wheat has grown as follows:—

Year	Bushels
1870	16,732,873
1919	193,260,400

Manufacturing has shown a similar extraordinary advance

Manufacturing Industries.

Year	Capital Invested	Employees	Value of Products
1881	$165,302,623	254,935	$309,676,068
1917	2,786,649,727	692,067	3,015,577,940

The products of the forests, of the mines and of the fisheries and the volume of banking and insurance business have shown the following great increase in values under the National Policy:

FOREST PRODUCTION.

Year	Log Products and Wood Pulp
1881	$39,540,570
1919	140,381,584

MINERAL PRODUCTION.

Year	
1889	$14,013,113
1919	173,075,913

FISHERY PRODUCTION.

Fiscal Year.	
1879	$13,529,254
1918	60,243,429

CHARTERED BANKS.

Year	Paid up Capital and Reserve
1888	$79,218,565
1919	243,912,111

Year	Total Bank Deposits by the Public in Canada
1878	$71,900,195
1919	1,841,478,895

AMOUNT OF LIFE INSURANCE POLICIES IN FORCE.

Year, Dec. 31st.	Amount.
1878	$84,751,937
1919	2,187,833,396

AMOUNT OF FIRE INSURANCE POLICIES IN FORCE.

Year, Dec. 31st.	Amount.
1878	$409,899,701
1919	4,904,396,461

Since 1878 the composition of our population has changed. Then the great majority of the people were engaged in farming, lumbering and fishing. There was comparatively little business activity and those who could not be employed in the above industries were forced to emigrate with the result that some millions of Canadians are living in the United States today who would never have left Canada if opportunities for employment had been available. After 1878 the industrial system of Canada began to develop until today it directly supports 2,000,000 Canadians, and in addition, yields indirect opportunities to several millions more.

Transportation.

In 1879, the year after the adoption of the National Policy, there were only 6,484 miles of steam railways in Canada. A glance at the following table will show a great increase in the mileage, in the amount of freight carried, and gross earnings:—

	1879	1889	1899	1909	1919
Miles in operation..	6,484	12,628	17,141	24,104	38,896
Tons of freight....	8,348,310	17,928,626	31,211,753	66,842,258	116,699,572
Gross earnings.....	$19,925,066	$42,149,615	$62,243,784	$145,056,336	$382,976,901

The railways opposed the reciprocity agreement in 1911 with the United States on the ground that such an agreement would build up north and south traffic at the expense of east and west traffic, and would depreciate the value of the huge investments in our transportation systems.

This is even a more important question than it was in 1911, because the Government now owns two out of the three transcontinental railways, and will have to pay deficits out of general taxation.

The organization of the Canadian Government Merchant Marine marks a new period in the history of the country's development. The first vessel was commenced in May, 1919, and by the end of the year, twenty-two ships ordered by the Government were completed. It is expected that by the end of 1920, sixty ships will be in commission. These ships were built in Canadian shipyards, largely from Canadian materials, and by Canadian workmen. The outfitting of these vessels is done in Canadian ports and with Canadian goods. They are manned chiefly by Canadian seamen, and are now carrying Canadian goods abroad.

British and Foreign Capital Invested In Canada.

One of the most remarkable developments attributable directly to the adoption of the protective system in Canada, is the investment of British and foreign capital in this country. At the present time there are over 600 branches of United States' factories in Canada, employing about 87,000 people and representing invested capital of about $400,000,000. While a few of these concerns might have come to Canada if there had been free trade, it is an absolute fact that the great majority came to Canada be the Canadian Customs Tariff stood as a partial barrier to the importation of products manufactured by the parent concerns in the United States. Although the number of branches of British factories established in Canada is small in comparison with the number of United States' branches, as against this, according to Sir George Paish's estimate in 1911, the sum of $1,860,000,000 of British capital was invested in Canada at that time, a considerable proportion of which was invested in manufacturing enterprises.

Growth of Canadian Agriculture.

The Canada Year Book of 1918, published by the Dominion Bureau of Statistics, Trade and Commerce Department, gives interesting statistics in regard to Canadian agriculture. On page 219 of this volume, the following extract appears:—

"If to the estimated value of agricultural production in 1917, viz., $1,621,028,000, be added for land, $2,792,229,000, for buildings, $927,548,000, for implements, $387,079,000, and for live stock $1,102,261,000, the total estimated agricultural wealth of the Dominion of Canada for 1917 amounts to $6,830,145,000."

That was Canada's agricultural capital in 1917.

Realizing the importance of agriculture, the Dominion and Provincial Governments have given special attention and substantial financial assistance to this basic industry.

Of recent years the money appropriated for railway extension has been spent almost entirely with the intention of providing better facilities for the agricultural communities, and possibly no commodity carried by the railways of Canada enjoys a better rate than farm grains.

All these measures are sound, and consistent with the doctrine of protection, because they are designed to stimulate and safeguard the great basic industry of agriculture.

Replies to Free Trade Arguments.

Free trade arguments are being used today as the spear head of the attack against the protective system in Canada. It may be that many who use the free trade arguments do not believe in them, and are merely trying to create a diversion from which they may profit. But, since these free trade arguments are being used to attack the National Policy, it is necessary to show why they cannot be applied profitably to Canada.

One of the chief free trade arguments is to belittle the value of the home market, especially to farmers. It is stated that Canadian farmers sell their products in an open market where the prices are fixed by international competition, and that they buy what they need in Canada which is described as a closed market. For 1919 the gross value of the agricultural production of Canada has been officially estimated at $1,975,841,000. During the same year, exports of unmanufactured farm produce were valued at approximately $315.000,000, or if butter and cheese be included, at a little over $361,000,000. In other words, only between 16 and 18.5 per cent. of all the produce of Canadian farms was exported in the unmanufactured state while between 81.5 and 84 per cent. was marketed in Canada.

The home market under normal conditions is a constant market. In a country where the population is steadily increasing it is a growing market. The foreign market or open market is an uncertain market. It may be lost entirely through war. It may be restricted through legislation or economic causes.

It is natural that the argument about selling in foreign markets and buying in protected markets should be most strongly urged in Western Canada, where grain is grown for export. But the conditions of agriculture are changing very rapidly in Western Canada. Not so many years ago wheat was the principal source of farm revenue in Ontario. What is the case now? Figures for the year 1917 show that wheat constituted 5 per cent. of the total value of the farm produce of Ontario.

Roughly speaking, a new country starts growing wheat and gradually develops into mixed farming, and the progress of the Prairie Provinces away from the wheat growing stage to the mixed farming stage has already reached extensive proportions.

The increase in farm live stock betweeen 1911 and 1916 in the Prairie Provinces is set forth in Table 18, page 195 of the Canada Year Book, 1918.

Prairie Provinces	Increase per cent.
Horses	54
Milch Cows	69
Other Cattle	47
Total Cattle	53
Sheep	73
Swine	91
Poultry	23

The growth of industry in Manitoba, Saskatchewan, and Alberta is also extraordinary. In 1900 the value of goods manufactured in these three provinces was a negligible quantity. For the present year a very conservative estimate would place the value of the goods manufactured in the three Prairie Provinces at $300,000,000. In 1900 there was not a single member of the Canadian Manufacturers' Association located West of the Great Lakes. At the present time there are seven hundred,—five hundred of these in the Provinces of Manitoba, Saskatchewan and Alberta. In fact Western Canada is becoming rapidly industrialized,—the industries which have made the greatest strides being milling, packing, steel and iron, clothing, textiles, building and paper.

The Canadan home market that absorbs farm produce is the population of the cities, towns and villages. Analyze city, town and village, and it will be found that a considerable part of the activities of their inhabitants has its origin and existence in the factories. Manufacturing is the life blood of wholesale and retail trade, transportation, professional practice, and commercial enterprises. Business clusters around the factory. Close or restrict the factory and business dwindles and the home market declines.

Another free trade argument is that under the protective system industry is developed at the expense of agriculture.

Taking the Canada Year Book's estimate of the agricultural capital of Canada in 1917 of $6,830,145,000, and dividing this sum by the number of farms in Canada, given by Government statistics as 730,000, we find that the average capital per farm was $9,356. Moreover, our industrial development has not caused any undue depopulation of the rural areas. In 1911 the rural population of Canada was 54.47% of the total population. This is a marked contrast to Great Britain, where the rural population was 49.8% of the whole when free trade was adopted in 1846 and had fallen to 21.9% in 1913.

It is also argued that. as Canadian manufacturers during the war produced munitions which compared favorably with those produced by other countries, they do not need protection now. This argument ignores the extraordinary conditions governing the munition industry. There was no competition. The price of munitions was fixed and calculated to yield a reasonable margin of profit where the business was efficiently conducted. The work was done to standard specifications. No selling force was required; because the market took all the supply. More important still, Canadian manufacturers secured the opportunity to manufacture in large quantities. That is the pressing need to day, and the home market is necessary to supply it.

It is also argued that protection causes combines.

Proper trade organizations produce greater efficiency, better quality and lower prices. Improper organizations can be prosecuted under existing laws. In any case, industrial combination has not reached undue proportion to date in Canada. The census places the number of manufacturing establishments at about 35,000, although this includes concerns which can scarcely be called factories. As the number of factory employees is estimated at about 700,000, the average number of employees per industrial establishment in Canada is about twenty.

A more serious charge is that Canadian manufacturers take undue advantage of the tariff, for example, by adding freight and duty to selling price of competing products in fixing their own selling prices. We do not defend such practice, but we submit that specific charges should be made against the offenders rather than general statements against all manufacturers, or against the protective system.

We beg to draw attention to an unfair method of attacking manufacturers, and through them, the protective system. A few manufacturers who have enjoyed marked prosperity are singled out. They are attacked in a sensational manner in the press and on the platform. Their profits for particularly successful years are advertised. Their financial statements are analyzed unfairly. No attempt is made to average the lean years with the good years. No tribute is admitted to efficiency, economical management, or unusual business ability. These outstanding examples of prosperity are held up to the public as a general condition of entire industries.

This method of argument is as unfair as it would be to hold up some phenomenal case of profitable farming or a lucky strike in mining as an example of how agriculture or mining pays generally.

A recent survey of the shoe manufacturing industry shows, first, that a very considerable number of firms have tried to succeed in this industry but have become bankrupt, and, second, that the average return on the capital invested in the shoe industry was 5.29 per cent. per annum. Dun's estimate of failures of Canadian manufacturing firms for the years indicated are as follows

Year.	No. of Failures of Mfg. Firms
1918	232
1915	655
1908	426

This is the other side of the story.

For the year ending March 31st, 1921, the Minister of Finance, in his budget speech, estimated that Canada's balance sheet will be:

Estimated expenditure (including capital outlays)	$549,649,428
Estimated revenue	381,000,000
Estimated deficit	$168,649,428

Adopt free trade, lose the customs revenue, which he estimated at $167,000,000, and the deficit will be $335,649,428.

Those who would abolish the Canadian customs tariff and thus lose the revenue which it produces, suggest that this revenue should be replaced by the imposition of the following taxes—a direct tax on unimproved land values and natural resources, increased taxation on personal incomes, increased inheritance taxes, and increased taxation on corporations. As to taxing unearned increment as such, no objection is offered, but it must be remembered that vacant land now pays taxes to the municipalities and in some provinces additional taxes to the provincial government. In fact, much vacant land has been given up by the owners in preference to paying the taxes now imposed. Income taxes are now paid by individuals to the municipalities and also the Dominion Government. Inheritance taxes are now imposed by all the provinces. Corporations are taxed as persons by municipal governments, provincial governments, and the Dominion Government, and also pay special taxes to every province for the privilege of being corporations. It is submitted that the suggested forms of direct taxation, while capable of some extension, cannot produce in one year the huge sum of $335,000,000 (or almost the present entire revenue of Canada).

The fact that the per capita amount of revenue raised by the tariff is greater in Canada than in the United States is often used as an argument that the Canadian tariff is too high. The explanation of the fact is simple. The United States imposes a high tariff on imports which compete with domestic products. But, because the United States has built up home industry by constantly adhering to the protective principle for 131 years, comparatively little is imported. Consequently, the amount of duty collected is smaller per capita than in Canada, not because the United States duties are lower, but because the volume of imports is comparatively much smaller.

United States Competition,

The United States, with a population of 105,000,000 buys from this country of 8,000,000 people only about one-half the value of the goods which it sells us. Our exports to the United States and imports from the United States for various years since 1907 follow:—

VALUE OF IMPORTS FROM UNITED STATES.

Fiscal Year.	Amount.
1907 (9 mos.)	$155,943,029
1912	356,354,478
1917	677,631,616
1920	802,096,817

VALUE OF EXPORTS TO UNITED STATES.

Fiscal Year.	Amount.
1907 (9 mos.)	$79,021,480
1912	120,534,634
1917	486,870,690
1920	464,029,273

Last year each inhabitant of the United States bought $4.41 worth of Canadian goods, while each Canadian bought $100.26 worth of United States goods. Significant also is the fact that our purchases from the United States were largely in manufactured goods while their purchases from Canada were chiefly raw material. It is not surprising that the rate of exchange is against Canada and that our money is at a heavy discount in the United States. This is the situation with a Canadian tariff. What would it be if the tariff were abolished? Canada, in competing with the United States, operates at present under certain disadvantages which may be summarized as follows:

1. The United States has maintained a protective tariff for 131 years; Canada for 42 years.

2. The United States has a more highly organized industrial system, supported by immense wealth.

3. The United States manufacturers are guaranteeed their home market of 105,000,000 people, guaranteeing a large output and specialization.

The Canadian home market of 8,000,000 has already been seriously invaded.

4. The United States has comparatively a greater labor supply.

5. The Customs regulations of the United States discourage Canadian imports while the customs regulations of Canada encourage United States imports.

Briefly, we cannot manufacture extensively in Canada at the present age and stage of our industries, unless these industries are given protection against the industries of the United States. We have two choices. We can abolish our tariff and allow the United States to manufacture for us, while we produce raw materials for them, or we can persevere in our determination that Canada shall continue to develop as a manufacturing country as well as an agricultural country.

In Europe there is a well known phrase "peaceful penetration." Translated, this means the domination of a small country by a big country. The small country, it is true, often keeps the forms of national independence after freedom has departed, and remains bound in fetters of financial and commercial subservience.

During the reciprocity campaign of 1911, ex-President Taft and the late ex-President Roosevelt were agreed that reciprocity would be a good thing for the United States. They wrote confidential letters to each other on the subject; then came the quarrel over the nomination for the Presidency and the correspondence was published by ex-President Taft on the 25th of April, 1912, at Boston, Mass.

In a letter from ex-President Taft to the late ex-President Roosevelt, the following extract occurs:—

> "The amount of Canadian products we would take would produce a current of business between Western Canada and the United States that would make Canada only an adjunct of the United States. It would transfer all their important business to Chicago and New York, with their bank credits and every thing else, and it would increase greatly the demand of Canada for our manufactures. I see this is the argument made against reciprocity in Canada, and I think it is a good one."

In his reply, the late ex-President Roosevelt stated: —

> "It seems to me what you purpose to do with Canada is admirable from every standpoint. I firmly believe in free trade with Canada for both economic and political reasons."

Those who do not believe Canadians when they point out the danger that free trade or a lowering of the tariff would bring to Canada, will perhaps believe such men as ex-President Taft and the late ex-President Roosevelt.

The above references to the United States are made in a friendly spirit. A certain amount of trade between the two countries is necessary and most desirable. But the people of the United States will appreciate the natural desire of Canadians to promote their own national development, while maintaining with the United States the most cordial relations.

Conservation.

There are two courses we can pursue in regard to our natural resources. We can plunder these resources and ship the raw or partly finished products out of the country to other countries, which will take these materials, manufacture them and sell them back to us in the shape of finished articles at greatly enhanced prices. The other course is to conserve, to manufacture in Canada not only the preliminary processes, but also the succeeding processes and export the products in a finished state. Under the first plan, for example, we would export our timber, ores and pulpwood. Under the second plan we would manufacture them into highly finished products for domestic and foreign consumption. Under the first plan only a limited amount of rough labor would be necessary. Most of the business connected with the processes of further manufacture, affecting banking, transportation and insurance, would go to enrich other countries, and part of our own population would be forced to emigrate in search of employment. Under the second plan we would carry these processes of manufacturing to the highest stage here, providing employment and creating business. The first plan is free trde. The second plan is protection.

Preferential Tariffs Within the British Empire.

On the whole, prospects seem bright for the general extension of British preferential tariff systems throughout British countries. Such an arrangement amongst British Overseas Dominions would correspond with the policy followed between the United States and United States overseas countries, including Cuba. A similar policy is followed toward their respective possessions by France and Italy, and was followed by Germany.

Canadian Factories in the War.

Shortly after the beginning of the war the Canadian factory system was practically put on a war basis, and munition making was organized. How Canadian factories succeeded in war manufacturing is illustrated by the following statement from the report issued by the War Cabinet and presented to the Imperial Government. "The manufacturing resources in Canada have been mobilized for war production almost as completely as those of the British Isles." Munition work was done chiefly under the control of the Imperial Munitions Board—which placed orders in Canada amounting to $1,200,000,000. At the peak of operations betweeen 250,000 and 275,000 workers were employed in making munitions including shells, parts, 64 wooden ships, 44 steel ships and 3,000 aeroplanes. At the same time Canadian factories largely supplied the Canadian people at home and the Canadian army abroad. About half the Canadian army came from the factories and half returned to the factories on demobilization. If we had not built up a factory system and allied business, if our manufacturing and business had been done for us largely by other countries, then Canada could not have sent as many men to the war, could not have supplied shells, ships and aeroplanes, could not have given large financial aid, and could not have absorbed her demobilized soldiers.

Conclusion.

In the course of this statement an effort has been made to show that manufacturing in Canada is inseparably connected with other industries; that two million wage earners and dependents secure their living through manufacturing, and that the most of the remainder of the population derive indirect benefits; that this country as a whole has made remarkable progress under the National Policy of protection; that, with the entire world swinging towards protection, Canada cannot relinquish it; that the revision of the tariff should be scientific and take into consideration the requirements of all classes, that a stable fiscal policy of protection with some assurance of permanence is a vital need; and, finally, that the aim of the fiscal policy determined as a result of this enquiry should be to advance Canada towards her destiny as a fully developed nation within the British Empire.

Fairbanks-Morse "Z" Engine with Bosch Magneto

Now-There is Only *One* Farm Engine

JUST think of the famous "Z" Engine with a Bosch high-tension, oscillating magneto—which delivers a steady succession of hot, intensive sparks. ¶ Every farmer in Canada should at once call on the nearest "Z" Engine dealer and see the result of this recent epoch-making combination—FAIRBANKS-MORSE "Z" ENGINE WITH BOSCH MAGNETO. ¶ Mechanical perfection, plus power—and right price—to date sold the "Z" Engine to over 250,000 farmers. ¶ This quality and quantity production enabled us to contract for a large proportion of the extensive Bosch facilities for making this one possible "Z" betterment, which establishes a new farm engine standard. ¶ And all Bosch Service Stations throughout Canada will assist our dealers in delivering maximum engine service.

Dependability Assured By Government Test

THIS drawing is from a photograph taken while a Canadian Government inspector was testing a Renfrew Two Wheel Truck Scale. Every Renfrew Scale is tested thoroughly in this way. The slightest defect or inaccuracy means complete rejection for that scale. So that only the ones that conform perfectly to requirements pass out of the work-shops to the Sales department.

After this inspector's test there can be no room for doubt as to the scale's absolute dependability. You can trust a Renfrew Scale always. The inspector's certificate is to be found in an envelope tacked on the bottom of the platform. The

Renfrew

TRUCK SCALE

has been fully approved by thousands of Canadian farming men and women. It will weigh anything from 1 lb. to 2000 lbs.—from a hen to a horse. It can be wheeled about as easily as an ordinary truck. When not in use it can be tipped up and stood in a corner out of the way.

It is a splendid money saver. One user wrote recently to say that he saved money with it "every time he used it." Another in *three ordinary deals*, saved $50! We have had hundreds of letters from Renfrew Truck Scale users, and in every case, the scale has been making and saving money.

With a Renfrew you can weigh your livestock before selling; weigh grain before taking it to elevator; weigh milk and find out the production of each cow; weigh milk and cream before taking to cheese factory or creamery; weigh all the supplies you buy; weigh all the live stock, poultry, vegetables, etc., that you sell; weigh the feed you give your stock. (These are only a few of the uses to which it can be put on the farm.)

The Renfrew is the most useful and handy scale ever invented. You cannot afford to be without one any longer: Write us to-night for prices and particulars.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, SEPTEMBER 28, 1920. Number 26.

The Woodstock Exhibition

The second annual Provincial Exhibition of the Carleton County Agricultural Society No. 41 was held on their beautiful grounds in Connel Park on September 13th to 17th inclusive. The weather man did not furnish good exhibition weather, cold winds and drizzling showers was his program for several days of the show period, thus deterring the best interests of the show.

Thousands of visitors, however, came from far and near, despite the weather man's frowns, to view the evidences of agricultural progress, to glean ideas and to take part in the general good time that prevails at well conducted exhibitions.

Mr. J. S. Leighton, Secretary, and Mr. D. V. Storm, Manager, of the fair, and their assistants, did everything in their power to make matters as pleasant and profitable as possible for the exhibitors and visitors alike. A more obliging and efficient pair of exhibition managers than the gentlemen above referred to would be difficult to find. Their attitude towards the exhibitors was such that it engendered the resolution among the exhibitors to show again next year and help make the fair bigger and better from the agricultural standpoint.

The main building contained the tastily arranged booths of a number of manufacturing concerns. In the centre was the display of field, garden and orchard produce. While there was a good display in this section, there is still ample room for the good farmers of Carleton county to come to the fore and put up a display that will be representative of their splendid agricultural county. A new building erected at the southern end of the main building housed the automobile display. In this building is also located the executive office. Additional buildings have also been erected to accommodate live stock.

Horses.

Among the prize winners in the horse classes were: J. W. Gallagher, Woodstock; A. J. Saunders, Houlton, Me.; Herb. Lindsay, Woodstock; Clover Nook Stock Farm, Hartland; Elisha Shaw, Hartland; L. B. McElhinney, Woodstock; A. C. Lund, Mt. Pleasant; Murdock Allen, Hartland; Harry Reade, Plymouth, N. B.; E. B. Avery, Woodstock; G. Donald Peabody, Woodstock; E. C. Allen, Hartland; Geo. Benn, Houlton, Me.; Wm. Ritchie, C. H. Geary, Woodstock; Elisha Dickinson, Scott's Siding; Chas. Palmer, Warren Ball, Woodstock; Harry Corey, Woodstock; H. C. Jones, Millville; H. Hayden, Hartland; F. Everett, Woodstock; Sam Keys, Woodstock; Howard S. Kearney, Southampton; F. L. Hayden and Urof Rhoda, Hodgon, Me.

The awards were placed by Dr. E. Watson, of Toronto.

Dairy Cattle.

The competition in Ayrshire cattle was between McIntyre Bros., of Sussex, and Clover Nook Stock Farm, of Hartland. Some of the best animals in the McIntyre herd were showing at St. Stephen, but despite this fact they captured the lion's share, capturing all the first prizes where they had entries. Clover Nook had the first prize aged bull and a number of second prize winners in the list.

Brown Swiss.

With the exception of first prize on a young bull and heifer which went to Dr. Griffin, of Woodstock, all the money set up in the Brown Swiss class went to W. A. Jolly, of Waterton, Que., on his well fitted, attractive herd.

Holsteins.

There was keen competition in the Holstein classes. Harding Bros., Welsford, N. B., vieing for the honors with Edwin Robinson, C. L. Smith, John W. Purvis, Earl Phillips, Clover Nook Stock Farm, Warren C. Ball, B. H. Avery, Herb Lindsay and H. Palmer, of Carleton County, and Frank Edwards, of Lower Millstream. Harding Bros. had the largest entry and carried off many of the choicest awards.

Jerseys.

E. de F. Holden, of Frelighsburg, Que., had plain sailing in the Jersey class with a herd that won favorable comment during the previous week at St. John. Other prize winners in the Jersey class were A. J. Raymond and Manzer Clark, of Woodstock.

The showing in dairy grades was limited.

In the dairy test for cows over 4 years old Harding Bros., E. de F. Holden and W. C. Bull were the respective winners of the first three places.

Harding Bros. also had the first and second prize winners in the section for cows under 4 years. All classes of dairy and beef cattle were judged by L. C. McQurt, of McDonald College.

Shorthorns.

There was a fair showing of Shorthorns, made up of individuals from the herds of H. C. Cochrane, Victoria, N. B., Hon. F. B. Carvell, Woodstock, N. B., Chas. P. Malmer and Shaw Bros., of Hartland.

Aberdeen Angus.

Horne Bros., Winsloe, P.E.I., had a good showing of Aberdeen Angus cattle. These progressive young men divided their herd at St. John and sent a number of head to both St. Stephen and Woodstock exhibitions.

Herefords.

One of the largest displays by any breeder was made by Mr. Geo. H. Benn, Houlton, Me., who exhibited a splendid array of well-fitted white faces.

Sheep.

The sheep exhibit was quite creditable. Several of our best breeders were on hand with their flocks. A number of Prince Edward Island Breeders as well as one breeder from Ontario. Clover Nook Stock Farm, Hartland, alone maintained the reputation of the New Brunswick sheep industry at the fair. A full list of awards as placed by F. W. Walsh, Acting Live Stock Supt. for the province, are published herewith.

Swine.

Swine were judged by Prof. Sackville, of the Ontario Agricultural College, Guelph. He was well pleased with the quality of the pigs shown. He made special mention of the splendid quality of the Berkshires shown by Shaw Bros., Hartland, and Yorkshires shown by Fowler Bros., Welsford, and Chas. Gray, of Woodstock.

A few Tamworths, Chesters and Poland Chinas made up the balance of the swine classes.

Poultry.

There was a good showing of poultry. J. W. Clark, Cainsville, Ont., placed the awards.

Aipiarian products were judged by L. T. Floyd, instructor in beekeeping for the New Brunswick Department of Agriculture. The display of bee products staged under Mr. Floyd's direction evoked a great deal of attention. Mr. Floyd knows the bee business from A to Z and many visitors availed themselves of the opportunity to ask questions..

The display of dairy products was not large but brim full of quality. Geo. Ransom placed the awards.

The largest exhibitor of fruit was Mr. Hubbard, of Oromocto. Carleton county exhibitors were, Geo. Tedlie, Lower Brighton; W. S. Kearvey, C. H. Gray, D. G. Purvis, Sanford Pugsley, Woodstock; and Mrs. Elmer Burpee, Jacksonville.

In agricultural products Mr. Allen Bezanson, Hampton, N. S., was an extensive winner. McIntyre Bros., Sussex, were prize winners in field grain. Geo. H. Benn, Houlton, Me.; Wm. Malmain, Harrison H. Rogers, G. W. Shaw, Sanford Pugsley, F. E. Foster, Warren C. Bull, C. H. Gray and John Milberry, Woodstock, and G. Shaw, of Grafton, were also prize winners.

"Our Orchard Possibilities" was amply set forth by an apple exhibit displayed by the New Brunswick Department of Agriculture.

One of the most valuable features to the farmers of Carleton county was the display made under the auspices of the Dominion Entomological Branch by Geo. E. Sanders, in charge of spraying investigation work in the Maritime Provinces.

Interested potato growers kept Mr. Saunders and his assistants talking Bordeaux, a subject dear to his heart. New ideas on spraying and dusting potatoes to combat blight and rot were daily dispensed.

The ladies' work was of high quality. The Women's Institutes also made a good showing.

The town of Woodstock and the county of Carleton have just reason to be proud of their exhibition plant. The town's people are doing their share nobly and well. Let the farmers perform their share at future exhibitions by planning to show the best products of their fields, gardens, orchards and the best of their live stock and thus make a showing worthy of the agricultural possibilities of their country.

PRIZE WINNERS AT WOODSTOCK.

HORSES.

Standard Bred.

Filly, 4 years old—1, J. W. Gallagher, Woodstock.

Filly, 3 years old—1, A. J. Saunders, Houlton, Me.; 2, Herb Lindsay, Woodstock.

Foal of 1919—1, Clover Nook Stock Farm.

Brood Mare With Foal by Her Side—1, Clover Nook Stock Farm.

Hackneys.

Stallion, 4 years and over—1, Elisha Shaw, Hartland.

Clydesdales.

Stallion, 4 years old and over—1, L. B. McElhinney, Woodstock; 2, A. C. Lund, Mt. Pleasant.

Stallion, 3 years old—1, Mudock Allen, Hartland.

Stallion, 2 years old—1, Harry Reade, Plymouth, N. B.

Brood Mare, 4 years and over—1 and 2, E. B. Averey, Woodstock.

Filly, 3 years old—1, Clover Nook Stock Farm.

Filly, foal of 1920—1, S. B. McElhinney.

Stallion, any age—Diploma, L. B. McElhinney.

Stallion and 3 of his get—Diploma, L. B. McElhinney.

Best Foal of 1920, get of Baron Squire—1, G. Donald Peabody, Woodstock.

Mare, any age—L. B. McElhinney.

Percherons.

Stallion, 4 years old—1, E. C. Allen, Hartland; 2 and 3, Geo. Benn, Houlton, Me.

Stallion, 3 years old—2, Wm. Ritchie, Woodstock.

Brood Mare, 4 years and over—1, C. H. Gray, Woodstock.

Filly, 3 years old—1, C. H. Gray.

Stallion, any age—1, E. C. Allen.

Mare, an age—1, C. H. Gray.

Suffolk Punch.

Stallion, 4 years and over—1, Elisha Dickinson, Scott's Siding.

Saddle Horses.

Ridden by a lady—1, Chas. Palmer, Woodstock; 2, Warren Bull, Woodstock.

(Continued on page 914)

The Care of Turkeys

The Breeding Stock.

How to Select.—Turkeks mature slowly. Males reach full growth at three eyars of age; females at two. Select hens from two to five years old for mating to two or three-year-old toms. The male is at his best in his third year. Old hens lay larger eggs and their young are not only larger but stronger than the young from immediate stock. Never breed related birds for the production of market stock, as it is almost certain to result in a high death rate among the poults. For breeding for the market, select medium-sized birds, plump but not fat, fine in bone, active and vigorous and not above standard weight. For breeding exhibition stock the largest-framed birds are generally chosen. Mate from ten to fifteen females to one male.

How to House.—A high shed affording protection on three sides but wholly open to the east and provided with high perches makes an ideal turkey's roost. If there is danger from coyotes or other wild animals, the open side should be seurely covered with wire netting. Turkeys will not make good breeding stock if housed with hens in a damp, badly-ventilated hen house. They are more liable to disease than hens. They will endure cold much better than foul air. They must be kept free from lice and mites, and should be occasionally dusted with a good lice powder and provided with a dust bath Give them leaves or straw litter to scratch in for their grain and permit them ts much range as is possible.

How to Feed.—Avoid over-feeding the breeding stock. Their ration should include less corn than oats, wheat, clover, or alfalfa. Oats are unquestionably the best grain to feed, and are better fed sprouted than dry. If a wet mash is used the following is good One part by measure of cornmeal, two parts of bran, one part chopped onion or raw apples or cooked mashed carrots or potatoes, and one part meat scrap or clabbered milk; mix with boiling water and allow to steam before feeding. Many breeders feed only a dry mash of 8 parts of bran to 1 part of beef scrap. Where bugs are plentiful on the range, no mash is really needed. The birds should be kept active and ready to forage at all times.

Hatching.

Nests.—In spite of attempted domestication, the turkey remains semi-wild. Instinct leads her to steal away to nest. The tom anticipates her absence while hatching, resents it and tries to keep her in his company by breaking up her nest. She, therefore, lays as far away from her roost as she can and in a secluded place, and tries to cover her eggs with grass or twigs whenever she leaves them. To tempt the hen to lay near home, provide nests of loose straw in empty barrels laid on the side, or in rough A-shaped cooped, or in dry weather, by merely putting a generous wisp of dry grass or a heap of leaves in a convenient hollow, and screening the place loosely with branches. Turkey hens lay from 12 to 20 eggs in a clutch. One service from the tom feertilizes all the eggs of the clutch and he can safely be removed thereafter, if found an annoyance. Eggs should be gathered as fast as laid and a couple of china or hard-boiled hens' eggs used to replace them. Write upon each egg with lead pencil the date when it was gathered and hold eggs for hatching not to exceed 10 days. Keep them on the side and turn daily. They are best held at a temperature of from 50 to 60 degrees.

Chicken Hens Versus Turkey Hens for Hatching—It is a good plan to use chicken hens to hatch the first clutch of eggs a turkey lays because, if broken up, she will in a week or ten day be laying again. She may profitably be used as a mother, when she has laid out her second clutch, since she rarely lays a third. A chicken hen will cover 8 to 10 eggs; a turkey 18 to 20.

The advantages of the chicken hen as a mother are:

1. As a rule she is tamer than the turkey hen and stands handling and moving better.
2. She will not wander so far from home, tiring the poults out so that they are unable to make the return journey.
3. She generally seeks shelter from rain, and almost always brings the poults home to roost.
4. She will fight for her brood and watch for hawks or coyotes better than a turkey hen.

On the other hand the turkey mother has these advantages:

1. She seems to understand turkey nature better than a chicken hen.
2. She is slower in movement, more careful about stepping on the poults, and broods them more frequently than the chicken hen.
3. She does not wean the poults so young as does the hen and at an age when they generally most need a mother's care.

It is generally recommended that the earliest laid eggs be hatched under chicken hens, but that later some turkey mothers be used in order that, if possible, the poults when weaned by the chicken hens be added to the flocks with turkey mothers and taught to forage with them, thus making fewer and larger bands for the turkey raisers to guard.

Incubation.—Turkey eggs require 28 to 30 days for hatching. The older the eggs the slower they are to hatch. The greatest care should be taken to keep the sitting hen free from lice or mites. Make nests in new boxes. Dust both nest and mother at least twice during the hatch with a good powder. Persian Insect Powder (Pyrethrum) is as effective as any. It can be purchased at any drug store; is not harmful to the eggs. Do not use sulphur around the nest. It is most essential that there be no lice on the young poults during the first week of their lives. A few lice may either kill them outright or so weaken them that they succumb to disease. Fresh drinking water and a dish of cracked corn and oats wixed with a little grit and charcoal should be kept where the sitting hen can help herself at will. Turkeys are very persistent sitters and often wil refuse to leave their nests for days at a time. They should, therefore, be watched and if they fail to leave the nest every other day they should be gently removed and fed and watered before bing allowd to return.

It is gnerally safest to remove the poults from the nest as they hatch because the mother will remain on the nest longer and often the last eggs do not hatch until from 24 to 30 hours later than the first ones. In very dry weather it is a good plan to build the nest out of grass or straw placed upon a sod turned rootside up, hollowed out bowl-shaped and thoroughly soaked with water. Also to sprinkle the eggs lightly with watch at from 90 to 100 degrees about the 20th day of incubation.

Care of the Poults.

When the last egg has hatched remove all the poults to a warm, flannel-lined basket out of sight and sound of the mother hen Feed and water her and let her move about for a short time. Then remove mother and poults to a clean, new coop with a small grass runway made of 12-inch boards. If the ground is cold and damp the coop should have a board floor; if not, let the little poults live upon the ground from the start, but move coop and runway upon fresh soil at least every other day.

Feed the poults for the first time when they are from 24 to 30 hours old. There are many different ways of feeding recommended by different breeders and probably there are many different rations that give equally good results under right care and environment. Several rations are given below, any one of which will doubtless prove satisfactory, but the following directions all successful turkey breeders subscribe to:

1. Do not change from one ration to another. Select your method of feeding and stick to it.
2. Feed very little, always leaving the poults a little hungry.
3. Feed often; the first ten days once in two hours.
4. Give no sloppy food.
5. In a natural state young turkeys live upon flies, spiders, grasshoppers, grubs, snails, worms, eggs, etc., together with seeds and berries. Little turkeys need more animal food than little chicks and hard-boiled egg and milk are the best substitutes for flies, bugs, etc.
6. Dry cornmeal will swell in their crops; ferment, and kill them. Use cracked corn and cornmeal sparingly while poults are young and always scald before feeding.
7. Remember you must build a large frame, big organs, much muscle, heavy plumage; therefore feed builders, not fats.
8. As soon as the poults jump over 12-inch boards allow them range. They need exercise to have healthy livers, but never allow them to range over ground on which many chickens have run.
9. When the poults begin to droop under the direct rays of a warm sun, shade must be provided.
10. Lice, dampness, filth and overfeeding kill most of the poults that fail to live.

Ration 1. One hard-boiled egg for every eight poults added to stale (but not sour wheat bread dipped in hot milk and squeezed very dry. Crumble egg, including shell, and bread together and season with black pepper sparingly. Feed this for two weeks or more, alternating the egg with cottage cheese or clabbered milk. After two weeks, replace the egg with best grade of beef scrap, and keep clabbered milk before them all the time; but if they can find insects and seeds on the range feed only the milk after the third week. When beef scrap is fed, it must be absolutely fresh and sweet. Sift and use only the finer portion.

Ration 2. One raw egg for every eight poults added to a pint of bran and enough clabbered milk to mix rather dry. For the first fourteen days feed on a clean shingle once in two hours all they will clean up eagerly. Use pepper or ginger only in case of sickness. After the fourteenth day gradually replace the bran, etc., by chick food, using care that it is not mouldy or musty or tainted in any way.

Ration 3. Fresh, dry, steel-cut oatmeal alternated with stale bread dipped in sweet milk and squeezed very dry, then mixed with hard-boiled egg. After two weeks replace the steel-cut oat meal by finely cracked wheat and finally by whole wheat. In place of the egg well-cooked, finely-chopped liver or lean meat may be fed occasionally.

With all these rations it is most important to feed fresh watch, clean, sharp grit, granulated charcoal and plentifully of finely-chopped, tender grass or dandelion leaves, sting nettle, radish tops, onion tops, lettuce, etc. Some claim a range upon green oats will cause diarrhoea, but a grass range is ideal. Others claim that the feeding of both sweet and sour milk in the ration at the same time will cause bowel trouble. In many cases it does not do so, but the possibility should be noted.

Ten Commandments for Prevention of Disease.

1. Never feed on the ground where food may be left to ferment, sour or mould, and later be eaten.
2. Never over-feed, especially of egg or mash. Remember that in a wild state turkeys are more often hungry than not.
3. After two weeks of age in good weather, let the hens take the poults and go. They do not need coddling, but they do need protection from weather, beasts of prey, etc.
4. Keep the poults and their coops free from lice. Use Persian insect powder to dust them or a drop of olive oil on the head, at the quill of the wing feathers, and around the vent.
5. For a tendency toward bowel trouble feed boiled rice. Bowel trouble indicates improper feeding or exposure to dampness and cold, or both.
6. Do not permit poults to run over ground which chickens, pigs, ducks, geese, etc., have made filthy. Plow up such ground or keep the poults yarded away from it.
7. When the poults have been chilled or seem droopy and need a tonic, make it as follows: Boil a pint of milk, put in it a shake of red pepper, add a table spoonful of alcohol; then beat up a raw egg and add to the miqture. Use this to moisten the bran mash. A little finely-chopped lean meat may be added.
8. Use green food finely cut in quantity in all rations as an aid to digestion.
9. Be especially watchful of the poults when at about six weeks of age, they "shoot the red," that is, begin to grow the protuberances on the head and neck. The danger is of the blood flowing pack upon the heart and becoming stagnant, the intestines become clogged and inflammation and diarrhoea follow. The following treatment will prove helpful: Mix one tablespoonful of red pepper and two tablespoonfuls of wheat middlings with water and make into four pills—bake hard. Give one pill three times a day to a full-grown turkey or a smaller pill in proportion to size of fowl. Follow with a tablespoon of castor oil for the old turkey or a teaspoonful for a young poult.
10. Call the turkeys home to roost by feeding them a little grain every night.

Fattening Rations.

Commence to feed turkeys early in the fall to get them ready for the Tranksgiving market. Feed night and morning only, and sparingly the first ten days. The principal food should be whole corn, the older the better, to avoid bowel trouble.

It is the belief that cold weather makes fat turkeys. The real reason is that in a warm fall the ground keeps soft, vegetation lingers and plenty of worms and bugs abound. As a result the turkeys make long forages, eating the worms and bugs. This excessive trave lthins them, and walks all their soft and fine flesh into tough, stringy muscle. On the other hand, a cold fall, with early frosts and snows, freezes the ground and kills the bugs. The turkeys wander less, loaf around the barnyard, gorge an abundance of grain and put on flesh.

Turkeys allowed to run in a patch of field peas will finsh off fairly well with a night feed of wheat or corn. If turkeys are fed on a grain ration of equal parts of oats, boiled carrots, potatoes and milk, a meat is produced

(Continued on page 932)

THE NEGLECTED FARM ORCHARD

From the time the farm orchard is planted, and while the trees are young and not bearing fruit, it is in danger of being neglected. But whether the trees are young or old the orchard needs careful oversight all the time because its trees are exposed to attacks of diseases and enemies, to accidents if they are cultivated; to injury by storms, by sudden and extreme changes in temperature, and by various other untoward influences. Some of these ills can not be entirely escaped. Ithers may to some extent be prevented and the evil effects of those which are inevitable can often be mitigated.

As far as damage by enemies is concerned, the chief reliance should be placed on preventive measures. It is a great deal easier to keep rabbits and mice away from trees than it is to treat the injuries which they have caused, and the results are far more satisfactory. If it is attended to in time, and properly done, spraying is an efficient means of protecting the leaves and fruit from the ravages of insects and of preventing or palliating the effects of various diseases to which trees are exposed. These things are so plain that anyone who cares for his orchard at all will be likely to give them some degree of attention.

But there are other ills to which the farm orchard is exposed which are not so promptly and plainly apparent. They come so gradually that unless there is close and frequent observation, they will not be recognized until they have made a good deal of progress. Low vitality of the trees, shown by slow and irregular growth and a general lack of thrift in their appearance, is one of the insidious and rather common evils which are liable to escape detection too long, but which greatly reduce productiveness and seriously impair the quality of the fruit obtained. In many cases, closer attention to the appearance of the leaves, and when the trees are in bearing, to the color of the fruit, would warn the owner more promptly and more positively that something was wrong than the superficial oversight which he gives. Such indifference is a serious matter, because the possibility of restoring such trees to full vigor and usefulness largely depends upon the promptness with which efforts are made to remedy the evils from which they are suffering. And if the decline is not checked by artificial means, it will be likely to proceed until the trees are ruined.

Then, too, there are cases in which growth is too strong instead of too weak. There are farm orchards in which trees that seemed to be plenty far apart when they were set, have become so large that they are suffering for want of room. If they had been closely watched, the need of more thorough pruning, or of the removal of some of the trees, would have been observed in time to prevent the harm that has been done. And many trees which have sufficient room have formed an excessive quantity of wood. This not only drains heavily, upon the vital forces of the trees, but it also reduces the yield and prevents the full development of the size and color of the fruit. And though they are not so numerous, there are, in all, many cases in which trees have grown far out of their proper shape and the evil has not been realized until they were badly deformed. The only adequate help for this condition is to be found in severe pruning. This should extend over two or three years. It will mutilate the trees, but this harm will be more than offset by the improvement in the appearance of the orchard.

When the causes are determined, the proper remedies for the ills which have been noted will suggest themselves. As a rule, the causes are so evident that they can not be mistaken by any ordinarily observant person, though there are cases in which they are more obscure. In such instances, the decline in the trees may be, and it often is, due to a lack of fertility in the land. Many trees which are unthrifty, and whose appearance strongly suggest disease, are suffering for the want of food. Instead of being sick, they are being starved. Such trees may need pruning, and attention to other details of approved treatment, but if any great and lasting benefit is to be obtained, there must also be an improvement in the physical condition and an increase in the frtility of the soil in which they stand.

In the orchard, as everywhere else, weakness and disease constantly and strongly tend to grow worse and worse. The only hope of checking their progress and of later recovering what has been lost, lies in a prompt, thorough and persistent application of suitable remedies. J .E. R.

HEATING THE FARM HOME.

The comfort of the home during the winter season is largely dependable upon the manner in which the house is heated. Modern heating systems are superior to stoves in more than one respect. In the first place, stoves are rather unhandy, especially where the house is large. If several rooms require heating, a number of stoves must be provided. A great deal of work, and a large amount of fuel is required to keep the fires going. One distadvantage incident to heating rooms with stoves is that it is difficult to keep the temperature even. One hour the stove will be red-hot, making the atmosphere too warm and stuffy. As soon as the fire dies down the room gradually becomes chilly. An even temperature is more comfortable and is also more healthful.

When the farmer decides that he needs a heating system, the next question which arises is the kind of a plant to install. The three principal systems in general use for heating homes are the hot water system, the steam heating system, and the hot air system. Several things must be considered when determinning which system is preferable. The size of the house, etc., must be considered. Usually the hot water system is considered the best for general purposes. However, where the building is large, or widely spread out, a steam heating plant will give better results than a hot water system. The hot water system is considered most economical in regard to fuel consumption. A steam heating plant is less expensive that a hot water system, while a hot air plant generally costs only about half as much as a hot water system.

The operation of a hot water system is very simple; this system is easy to take care of after it is installed and is exceptionally reliable. The heated water is forced to the radiators where it cools, giving off heat into the room. As soon as the water loses its heat it passes down to the bottom of the radiator through the return pipe back to the boiler where it is again heated. As long as a fire is kept burning so the water in the boiler is heated, the water will be kept constantly circulating through the pipes and radiators. A steam heating plant is especially suited for large installations, owing to the ease with which diastant radiators may be quickly reached. A building can be warmed quickly with a steam heating plant.

Many farmers use hot air systems for heating their houses and get excellent service. The hot air plant has an advantage over either the hot water or steam seat system, owing to its ventilating feature. This plant requires more fuel than either the hot water or steam heat systems.

The hot air system is easily installed; when the openings have been made in the floor and the different registers put in, the installing of the furnace proper is simple. Having determined where the furnace is to be located in the basement, the next step is to assemble it. After the furnace is assembled the casting should be put on, the water pan put in place and the holes cut in the bonnet at the desired places. The bonnet is then put on, the pipes are connected up to the different register boxes and boots in the wall stacks leading to the second floor registers, then the smoke pipe is connected with the chimney, the cold air duct is built and the system is ready for service.

An efficient heating system can hardly be considered a luxury; it is more a necessity. The conserving of fuel is an important consideration, as is the added comfort of the inmates of the household. A chilly room, no matter how elaborately itis furnished, is never comfortable. A modern heating system will eliminate any uncertainty in regard to warm, comfortable rooms.

ADVANTAGES AND PROFITS OF SYSTEMATIC CROP ROTATIONS.

The chief advantages of systematic crop rotation may be briefly stated as follows:

1. Rotation systematizes the farm wosk. There is a definite portion of land prepared for each kind of crop for each year and the areas of the crops grown remain constant. Farm work is more economically and efficiently conducted as a result.

2. In a systematic rotation each crop or season is handled in such a manner and is of such a nature as to be the proper preparation for the crop which follows. This results in increased average yields and greater efficiency.

3. The control of weeds, plant diseases and insects is facilitated by crop rotation, as frequent change of type of crop interferes with their multiplication and all good rotations provide regular recurrent times for a clean-up.

4. Any benefits from soil-enriching crops or soil-improving methods are distributed uniformly over a whole farm by a good rotation.

5. Frequent crop change avoids the soil depletion incvident to constant one-crop farming.

A good rotation should include at least one of each of the following:

1. Cash crops, i.e., crops readily convertible into cash and such as are likely to be reasonably sure of success and profit in the territory concerned.

2. Cleaning and moisture-storing crop or fallow, a regularly recurring period in the rotation which provides suitable opportunity for weed eradication and the accumulation of soil moisture.

3. Forage crop. All the best crop rotations assume live stock as an integral part of the farm system and forage crops must be grown to nourish them. Where conditions make live-stock-raising impossible, any permanent rotation must provide a substitute in the form of green manures.

4. Leguminous crop. No permanent system of agriculture has been built up anywhere that does not include in its rotation at least one of the nitrogen storing group of plants.

The rotations under test at Brandon include the following types:

1. Straight grain growing.
2. Grain growing plus hay crop.
3. Grain growing plus hay and hoed crops.

Those of the first type gave better results than unsystematized grain growing but are greatly surpassed in profit, freedom from weeds, freedom from soil drifting and general condition of the soil by both the others. A typical rotation of the second type surpasses the first by 44 per cent. in net profits in the average results of five years. A typical rotation of the third group excels the first by 75 per cent.

Some of the most striking facts in regard to crop sequence that have emerged from crop rotation work are:

1. The great value of corn as a preparation for grain crops.

2. The seeding for grasses and clovers should follow corn or summer fallow. The more intervening grain crops there are, the greater the chance of failure.

3. Wheat is the most profitable crop after fallow or corn.

Coarse grains are more profitable than wheat as second crop after fallow or corn.

5. Wheat makes a satisfactory nurse crop for grasses.

6. Field roots are less effective than corn as a preparatory crop for grain and sunflowers somewhat less though better than roots.—Synopsis of an address by W. C. McKillican, Superintendent, Experimental Farm, Brandon, Manitoba, at the Conference of Conservation of Soil Fertility and Soil Fibre, held at the Fort Garry Hotel, Winnipeg, July 14th, 15th and 16th, 1920, under the auspices of the Commission of Conservation.

BUILD SILO WHERE CONVENIENT TO FEED

The first consideration in locating the silo is to have it convenient; that is, as nearly as possible to the place where the bulk of the silage will be fed.

Another matter of importance is to have it on the least exposed side of the barn. A silo will freeze more readily on the north side of a barn than in the more sheltered position on the south side. However, many silos are built on the north side, and give good satisfaction, and it is better to have the silo conveniently located in another place than to have it convenitnely located on the south side. Where stock is kept in a basement barn, a silo can often be constructed on the upper side of the barn, and thus ten or more feet of the lower part of the silo be built below the ground, where freezing will be very slight. Under such conditions, the silo would be placed on the high side of the barn, regardless of direction.

The foundation is the first part of the silo to construct, and even if a patent silo is built the owner usually furnishes the foundation. The foundation is always important, but it is exceedingly important if a permanent type of silo is to be constructed, because if the foundation gives the wall is almost sure to crack.

Where drainage conditions are favorable—that is, where the soil is dry enough—the foundation should extend at least 5 feet below the surface of the ground. There should be a base 2 feet wide and at least 1 foot deep at the bottom, and above this a wall 8 inches or more thick.

Concrete is the most common material used. The foundation should rise from 6 to 12 inches above the level of the ground. There is no loss in extending the foundation a few feet below the surface of the ground, because this space may be used for storage for silage. Silage can easily be thrown out of a pit four or five feet deep. It is advisable to reinforce quite strongly the foundation, especially if it extends 8 inches or more above the surface of the ground.

THE DUTY ON IMPORTED CATTLE

Following is a certified extract from the minutes of a metting of the Treasury Board, held on the 20th May, 1920, approved by his Excellency the Governor General in Council, on the 26th May, 1920:

The Board recommend that the provisions of the Orders in Council of the 8th February, 1918, (P.C. 226), and the 30th January, 1919, (P.C. 1-233), providing for the remission and refund of duty on neat cattle imported into Canada, be further extended for a period of one year from the 7th February 1920.

(Sgd.) RODOLPHE BOUDREAU,
Clerk of the Privy Council.

The Honourable
The Minister of Agriculture.

The St. Stephen Exhibition

The twelfth annual St. Stephen Exhibition was held on September 14th to 17th. The weather man did not furnish a brand of weather that was conducive to the best interests of the management, the exhibitors or the visitors. A downpour of rain on the night of the thirteenth continued intermittently during the fourteenth and sprinkled and frowned during the remaining days of the fair.

Despite this fact, visitors thronged the grounds to see the biggest and best display of agricultural products and live stock ever witnesed at the border town fair.

Thih was the second time in the life of the show that competition was open to the Maritime Provinces and State of Maine.

So well pleased were exhibitors with the treatment accorded them in 1919 by W. S. Stevens, the obliging and indefatiguable secretary, and his staff of assistants, that they were ready and willing to help make the 1920 show from the exhibitors standpoint a success.

The standard of ideals set by our best live stock breeders has had a good effect on the local breeders, many of whom brought their stock into the show ring this year in better shape than they ever did before. The poorly developed individual has no longer a place at the St. Stephen fair. The Charlotte County breeders are just as intelligent as are the breeders of other parts of Canada, all they needed was to get the proper ideals fixed in their minds, and one by one they will breed and develop a better class of stock than they have had in the past.

The St. Stephen fair is therefore accomplishing one of the main objects for which it was established, and can well lay claim to be the best agricultural fair held in the Province of New Brunswick this year, and as such is entitled to any encouragement it may receive in the form of provincial grants and assistance in the way of furnishing judges for the respective departments.

The ladies fancy and domestic work departments at the St. Stephen fair are always well filled with exhibits of exceptionally fine workmanship. Miss Nutter of the Provincial Department of Agriculture, Women's Institute Branch, placed the awards in the domestic classes, while Mrs. E. McL. Hatt, of Fredericton, carefully and competently dispensed justice in the fancy work department. Particularly inteersting was the display made in the latter department by the Household Arts and Crafts, under the able direction of Miss Mowatt of St. Andrews, who has done and is doing so much to again revive useful arts, now almost forgotten by the younger generation.

The display of fruit was very representative of Charlotte Counties' fruit producing possibilities. Mr. Geo. Danley of the Department of Agriculture, placed the luscious fruits according to merit, and at the same time dispensed valuable information to the public on matters horticultural.

Located on the lower floor of the main building, where various manufacturing concerns displayed their wares, was an exceptionally fine display of field and garden products grown on Dominion Brand Fertilizers, staged by the Dominion Fertilizer Co. of St. Stephen, under the able direction of their chief representative, F. P. Hunter.

The products shown were well developed, and so staged that the booth was the chief centre of attraction for all who were interested in bumper crops.

Visitors who were not agriculturally inclined, found ample amusement in the midway, while all lovers of clean sport were regaled to their hearts' content at the race track, where some of the best horses in Maritime Canada and Maine, exhibited bursts of speed that were most exciting, while in the infield, sturdy ball teams competed for honors with bat and ball. It was rather interesting to watch the crowds that took a keen interest in the ball games, and who were so intent in their favorite game, that they did not seem to realize that the remainder of the throngs were exulting over the equine beauties on the track.

The display of agricultural products in Agricultural Hall was judged by Mr. O. C. Hicks, B.S.A., of the Department of Agriculture, Fredericton. The display was most creditable to the farmers of Charlotte County. The chief contestant in this department from outside the county was Mr. Allen Bezanson, of Hampton, Nova Scotia, who made such a good showing at St. John. The school garden exhibits were nicely staged and a credit to the work that is being done for the rising generation by the Elementary Agricultural Education Department, under the leadership of Mr. A. C. Gorham. The products displayed in this section by the boys and girls were well up to those displayed by their dads.

The display of dairy products was not large, but the judge, Mr. George Timmens, acting dairy inspector for the province, found therein exhibits of high quality.

Apiary products were judged by Mr. L. T. Floyd, Provincial Apiarist. The display was not an extensive one.

Horses

There was a good showing in the horse classes, particularly in the roadster, carriage, heavy draft and agricultural classes.

In the Aged Clydesdale Stallion section, Dr. McCoy, owned by H. C. Jewett of Fredericton, went down to second place. Miss Van Horne's imported stallion, Retinue, headed the list. David Johnston captured the red ribbon with aged mare, the blue going to a mare shown by Miss Van Horne.

Clayton's Indican and Jewett's Arlon were the only Percherons in the ring and were placed in the order named.

The aged Standard Bred Stallion prizes went to Native Worthy, The Exposer and Border Prince, in the order named.

A Cap Aubrey colt, shown by Hugh O'Neill, Fredericton, had no competition in the two-year-old stallion class.

In the absence of Dr. Pugsley of the Provincial Department of Agriculture, who was scheduled to place the awards, but who through illness was unable to attend, the judging of the horse classes was done by Mr. Edward Hogan of St. John.

There was a good showing in the sheep classes. The awards were placed by Mr. Angus Hay of the Experimental Farm, Fredericton. Miss Van Horne and Mr. W. F. McGibbon were the only Charlotte County exhibitors of sheep. The other exhibitors were J. R. Semple & Son, Truro, N. S.; J. H. King & Son, Sussex, N. B., and a number of Prince Edward Island exhibitors, all of whom received a fair share of the monies offered on their stock. One or two of the flocks were not as well finished as we have seen them in the hands of the same breeders on former occasions.

The display in the Swine department was judged by Mr. F. W. Walsh, acting Live Stock Superintendent for the New Brunswick Department of Agriculture. The show was not extensive, but there were some very classy individuals, among which special mention may be made of a pair of fat hogs, shown by the veteran feeder and exhibitor, Mr. Thos. McDonald of St. Stephen. Visitors to the fair always look for Mr. McDonald's pigs, as he has established a reputation for quality stock.

The display of Beef Cattle was almost all in the hands of Howe Bros. of Prince Edward Island, who exhibited a portion of their well fitted Aberdeen Angus herd, that made such a good showing at St. John during the previous week.

Dairy Cattle

The dairy cattle display was the big feature of the St. Stephen Fair. McIntyre Bros. of Sussex, and A. McRae & Sons of Charlottetown, P. E. I., with their accredited herd, were out to pit their herds against Miss Van Horne's Ayrshire herd from Coven Haven Farm, St. Andrew's, Charlotte County.

Fred S. Black of Amherst, N. S., placed the awards without fear or favor.

McIntyre Bros. aged bull, Morton Mains Amanth, went to the top of the list, over the St. John winner, Capt. Kidd, of the P. E. I. herd.

Miss Van Horne's Silver Clink had no competition in the two-year-old class, but in competition with a French Canadian bull from the same herd, and a Holstein bull shown by Moffatt Bros., he was good enough to capture the St. Croix Courier Silver Cup for the best bull any age or breed owned in Charlotte County.

The Male and Female championship went to McIntyre Bros., on their Low Milton McDonald, the imported junior yearling bull, and the senior yearling heifer, Spring Brook Nellie.

Lass o' Gowrie, the champion aged cow at St. John, went down to third place at St. Stephen in the aged cow class.

McRae's Fairville Queen 2nd, topped the list, and McIntyre Bros.' Spring Brook Orange Lily, standing in for second money.

The McRae's had the best dry three year old cow, as well as the best three year old cow in milk, capturing the honors with their Rosabelle and Beauty of Beaver Meadow.

The first aged herd prize went to the McRae's, while McIntyre Bros. captured the much coveted red on young herd, bull and three of his get, four animals get of one sire, two animals progeny of cow and best three heifers.

The competition throughout the Ayrshire class was keen and the well groomed red and whites made an exceptionally pleasing showing.

Holsteins

The lions share in the Holstein class went to Dickie Bros., Cobequid Farm, Truro, N. S., their main competitorh were M. K. Lyons of Calais, Maine, and Moffatt Bros. of St. Stephen. The Cobequid Farm herd were out in the pink of condition, while the other herds were only in good field fit. Jas. Bremner, Agricultural Representative, Chatham, placed the awards.

Brown Swiss

Ralph H. Libby of Stanstead, Que., made a good showing with his Brown Swiss.

Jerseys

Jerseys made a good showing. Mr. Bremner placed the ribbons, the most coveted of which went to J. R. Semple & Son, Truro, N. S.

Poultry

There was a good showing of grades.

The poultry display was quite creditable. Mr. Geo. Wilson of the Federal Poultry Division placed the prizes. The showing of ducks was particularly fine.

St. Stephen holds an annual fair, whether they receive a government grant or not. Plans are already under way whereby they purpose holding a show on the same dates in 1921, as those on which this year's fair. The rank and file of the citizens of the border town take an active interest in the affairs of the Exhibition; the exhibitors are well looked after; the attendance is usually large and expansion is the watchword.

PRIZE WINNERS AT ST. STEPHEN

Standard Bred Horses

Stallion, 3 years old—1, Jas. Belyea, St. John; 2 and 3, H. C. Jewett, Fredericton.

Stallion, 2 years old—1, Hugh O'Neill, Fredericton.

Brood mare with foal—1, Hugh O'Neill.

Mare, 3 years old—1, S. E. Rice, St. Stephen; 2, Hugh O'Neill; 3, W. F. McGibbon.

Filly, 1 year old—1, Wilfred Todd, St. Stephen.

Foal of 1920—Hugh O'Neill.

Carriage Horses to Halter

Brood Mare with foal—1, Hugh O'Neill.

Filly or Gelding, 3 years old—1, Hugh O'Neill; 2, J. Harold McMurray, Fredericton; 3, Moffatt Bros., St. Stephen.

Foal of 1920—Hugh O'Neill.

Carriage Horses to Harness

Mare or Gelding, 3 years old—1, J. Harold McMurray; 2, Hugh O'Neill; 3, Cliff Hanley, Moores Mills.

Hackeneys

Mare, 3 years old—1, J. Harold McMurray.

Saddle Horses

Mare or Gelding, 3 years old—1, Margaret A. Irving, St. Stephen; 2, J. Harold McMurray.

Percherons

Stallion, 3 years old—1, D. P. Clayton, Fredericton; 2, H. C. Jewett.

Clydesdales

1, Miss Van Horne, St. Andrews; 2, H. C. Jewett.

Mare, 3 years old—1, Aubrey F. Johnson, St. Stephen; 2, Miss Van Horne.

Farm or Work Horses

Farm Horse, 3 years old—1, Melborne & Reynolds, St. Stephen; 2, David Johnston, St. Stephen.

Team of Horses—1, Michael Gorman, Cork Station.

Heavy Draught Horses

Mare or Gelding, 3 years old—1, David Johnston; 2 and 3, Moffatt Bros.; 4, Geo. H. Budd.

Matched Team—1, Aubrey Johnston; 2, Moffatt Bros.; 3, Geo. H. Budd; 4, David Johnston.

Ponies

1, Wm. Gunter, Fredericton; 2, Ed. McCrea, DeWolfes; 3, Carmen Ganong, St. Stephen.

Pair Ponies—1, W. & P. Ganong, St. Stephen.

CATTLE

Polled Angus

All prizes in this class were awarded to Horne Bros., Winslow, P. E. I.

Ayrshires

Bull, 3 yrs. and upwards—1, McIntyre Bros., Sussex, N. B.; 2, A. McRae & Sons, Charlottetown, P. E. I.

Bull, 2 yrs.—1, Miss Van Horne, St. Andrews.

Bull, Senior, 18 mos. and under 24—1, A. McRae & Sons.

Bull, 12 mos. and under 18—1, McIntyre Bros.

Intyre Bros.; 2, Albion Moffitt, St. Stephen.

Bull, under 12 mos.—1, McIntyre Bros.; 2, A. McRae & Sons; 3, Miss Van Horne.

Bull, under 6 mos.—1, Miss Van Horne; 2, McIntyre Bros.

Cow, 4 yrs. and upward—1, A. McRae

& Sons; 2 and 3, McIntyre Bros.; 4, Miss Van Horne.

Dry Cow—1 and 3, A. McRae & Sons; 2, McIntyre Bros.; 4, Albion Moffitt.

Cow, 3 yrs.—1 and 3, A. McRae & Sons; 2, McIntyre Bros.; 4, Albion Moffitt.

Cow, 2 yrs.—1, McIntyre Bros.; 2, 3 and 4, A. McRae & Sons.

Heifer, Senior—1, McIntyre Bros.; 2, A. McRae & Sons; 3, Albion Moffitt.

Heifer, junior—1, McIntyre Bros.; 2, A. McRae & Sons.

Heifer Calf, 12 mos., over 6 mos.—1 and 3, McIntyre Bros.; 2, A. McRae & Sons; 4, Miss Van Horne.

Heifer Calf, 6 mos. and under—1, McIntyre Bros.; 2, A. McRae & Sons; 3, H. Trueman Lever, Rollingdam; 4, Miss Van Horne.

Aged Herd—1, A. McRae & Sons; 2, McIntyre Bros.; 3, Miss Van Horne.

Breeders' Young Herd—1, McIntyre Eros.; 2, A. McRae & Son; 3, Miss Van Horne.

Bull, any age, Diploma——McIntyre Bros.

Female, any age, Diploma—McIntyre Bros.

Bull and 3 of his get—1, McIntyre Bros.; 2, A. McRae & Sons.

Ayrshire Special Prize

4 animals, get of 1 sire—1 and 2, McIntyre Bros.

2 animals, progeny of 1 cow—1 and 2, McIntyre Bros.

Best Ayrshire Bull, any age—1, McIntyre Bros.; 2, A. McRae & Sons.

Best Cow, any age—1 and 2, McRae & Sons; 3, McIntyre Bros.

Best 3 heifers under 2 yrs.—1 and 2, McIntyre Bros.

Jerseys

Bull, 3 yrs. and upward—1, J. R. Semple & Son, Truro, N. S.

Bull, over 12 mos., under 18 mos.—1, J. R. Semple & Son.

Bull Calf, under 12 mos.—1, J. R. Semple & Son.

Bull Calf, under 6 mos.—1, Frank McGairity, Milltown, N. B.

Cow, 4 yrs. old—1, Frank McGairity; 2, J. R. Semple & Son.

Dry Cow—1, J. R. Semple & Son.

Cow, 3 yrs. old—1, J. R. Semple & Son; 2, Frank McGairity.

Cow, 2 yrs.—1, J. R. Semple & Son.

Senior Heifer—1, 2 and 3, J. R. Semple & Son.

Heifer Calf, over 6 mos.—1, J. R. Semple & Son.

Heifer Calf, 6 mos. and under—1, J. R. Semple & Son; 2, Hazen Linton; 3, F. M. McCready.

Aged Herd—1, J. R. Semple & Son.

Breeders Young Herd—1, J. R. Semple & Son.

Bull, any age, Diploma—J. R. Semple & Son.

Female, any age, Diploma—J. R. Semple & Son.

Ganong Bros. Ltd., Special Prize

Best Jersey Bull, any age—1, J. R. Semple & Son.

Jersey Heifer, 2 yrs. or under—1, J. R. Semple & Son.

Jersey Calf, 6 mos. old or under—1, J. R. Sefple & Son.

The St. Croix Courier's Prize Silver Cup to the owner of the best individual bull without regard to breed—Miss Van Horne, St. Andrews.

French Canadian

Bull, 3 yrs. old—1, Miss Van Horne.

Dry Cow, 3 yrs. or upwards—W. S. Poole, St. Stephen.

Any Other Pure Breed of Dairy Cattle Brown Swiss

All prizes in this class awarded to Ralph H. Libby, Stanstead, Que.

The makers of Surprise Soap Special Prize

Best Bull, any pure bred beef type—Horne Bros., Winslow, P. E. I.

Best Cow of any pure bred beef type—1, Horne Bros.

Best Calf, either sex, beef type, six mos. old or under—Horne Bros.

Holsteins

Bull, 3 years old—1, Dickie Bros., Truro; 2, Moffatt Bros., St. Stephen.

Bull, 2 years old—2, M. K. Lyons.

Bull, senior yearling—1, Moffatt Bros.

Bull, junior yearling—1, Dickie Bros.

Bull, senior calf—1, Dickie Bros.

Bull, junior calf—1 and 2, Moffatt Bros.; 3, Irvine Moffatt.

Cow, 4 years old and upwards—1 and 2, Dickie Bros.; 3, M. K. Lyons; 4, Hoffatt Bros.

Dry Cow, 3 years old—1 and 2, Dickie Bros.; 3, Moffatt Bros.

Cow, 3 years old—1 and 2, Dickie Bros.; 3, M. K. Lyons.

Heifer, 2 years old—1 and 2, Dickie Bros.; 3, Moffatt Bros.; 4, M.K. Lyons.

Heifer, senior yearling—1 and 2, Dickie Bros., 3, Moffatt Bros., 4, Albion Moffatt.

Heifer, senior calf—1 and 2, Dickie Bros.; 3, Moffatt Bros.

Heifer, junior calf—1 and 3, Dickie Bros.; 2, Moffatt Bros.

Herd—1, Dickie Bros; 2, Moffatt Bros.; 3, M. K. Lyons.

Breeders Young Herd—1, Dickie Bros.; 2, Moffatt Bros.

Best Bull, any age—Disploma and Clarke Bros.' Special—Dickie Bros.

Best Female, any age—Disploma and Clark Bros.' Special—Dickie Bros.

Bull and three of his get—1, Dickie Bros.

Grade Holsteins.

Cow, 4 years old—1, Moffatt Bros.; 2, Albion Moffatt; 3, Harry Reynolds.

Dry Cow, 4 years old—1, Howard Dinsmore.

Cow, 3 years old—1, M. K. Lyons; 2, Moffatt Bros.; 3, Albion Moffatt.

Dry Cow, 3 years old—1, Moffatt Bros.; 2, Albion Moffatt.

Cow, 2 years old—1, M. K. Lyons.

Heifer, 2 years old—1, Albion Moffatt.

Heifer, over 1 year old—1, Melborne Reynolds; 2, Albion Moffatt.

Heifer, under 1 year—1, W. F. McGibbon; 2, Moffatt Bros.

Heifer Calf—1, Alton Reynolds; 2, Harvey McGibbon; 3, W. F. McGibbon.

Herd—1, Moffatt Bros.; 2, Albion Moffatt.

Fat Cattle.

Beef Animal, not over 3 years—1, Moffatt Bros; 2, Albion Moffatt.

Grade Jerseys.

Cow, 4 years old—1, F. M. McCready; 2, Melbourne Reynolds; 3, Irvine Moffatt.

Dry Cow, 4 years old—1, M. K. Lyons; 2, Moffatt Bros.

Cow, 3 years old—1, David Hawthorn; 2, Irvine Moffatt.

Cow, 2 years old—1, Moffatt Bros.; 2 and 3, Irvine Moffatt.

Heifer, 2 years old—1, Melbourne Reynolds; 2, Irvine Moffatt.

Heifer, senior yearling—1, Albion Moffatt; 2, Irvine Moffatt; 3, M. K. Lyons.

Heifer, junior yearling—1, F. M. McCready.

Heifer, senior calf—1, Hugh Love.

Herd—1, Melbourne Reynolds; 2, Irvine Moffatt.

Grade Ayrshires.

Cow, 4 years old—1, Moffatt Bros.; 2. Melbourne Reynolds.

Heifer, 2 years old—1, A. McRae & Sons.

Heifer, over 1 year—1, H. Freeman Lever.

Heifer, senior calf—1, H. Freeman Lever.

Heifer, junior calf—1, H. Freeman Lever; 2, Moffatt Bros.

French Canadian Grades.

Cow, 4 years old—1, Henry Reynolds; 2 and 3, Irvine Moffatt; 4, L. B. Mitchell.

Cow, 3 years old—1, F. M. McCready.

Heifer, 2 years old—1, Moffatt Bros.

Heifer, over 1 year—1, F. M. McCready; 2, Irvine Moffatt.

Heifer, senior calf—1, Harry Reynolds.

SHEEP.

Leicesters.

Ram, 2 shears and over—1, S. L. Boswall, Pownal, P.E.I.; 2, W. F. McGibbon, More's Mills.

Ram, shearing—1 and 2, S. L. Boswall.

Ram Lamb—1, S. L. Boswall.

Ewe, two shears and over—1, 2 and 3, S. L. Boswall.

Shearing Ewe—1 and 2, S. L. Boswall.

Ewe Lamb—1, 2 and 3, S. L. Boswall.

Aged Pen—1, S. L. Boswall.

Pen Lambs—1, S. L. Boswall.

Lincolns.

All prizes in the Lincoln class went to Albert Boswall, French Fort, P.E.I., without competition.

Oxfords.

Ram Lamb—1, Jas. McAllister, Milltown.

Shropshires.

Shearing Ram—1, John H. King, Sussex, N. B.

Ram Lamb—1, John H. King; 2, J. R. Semple & Son.

Ewe, 2 shears and over—1, John H. King.

Shearing Ewe—1, John H. King.

Ewe Lamb—1, 2 and 3, J. R. Semple & Sons.

Pen—1, John H. King.

Pen Lambs—1, J. R. Semple & Son.

Southdown.

Ram, 2 shears and over—1, J. R. Semple & Son; 2, Miss Van Horne, St. Andrews, N. B.

Shearing Ram—1, J. R. Semple & Son; 2, Cephas Nunn, Winsloe, P.E.I.

Ram Lamb—1, J. R. Semple & Son.

Ewe, 2 shears and over—1, Cephas Nunn; 2, 3 and 5, J. R. Semple & Son; 4, Miss Van Horne.

Shearing Ewe—1, Cephas Nunn; 2, J. R. Semple & Son.

Ewe Lamb—1 and 3, J. R. Semple & Son; 2, Cephas Nunn.

Aged Pen—1, J. R. Semple & Son; 2, Cephas Nunn; 3, Miss Van Horne.

Pen Lambs—1, J. R. Semple & Son.

Hampshire Downs.

Ram, 2 shears and over—1, Cephas Nunn.

Ram, shearing—1, Cephas Nunn; 2, J. R. Semple & Son.

Ewe, 2 shears and over—1, 2 and 3, Cephas Nunn.

Shearing Ewe—1, 2 and 3, Cephas Nunn.

Ewe Lamb—1, 2 and 3, Cephas Nunn.

Aged Pen—1 and 2, Cephas Nunn.

Pen Lambs—1, Cephas Nunn.

Cheviots.

Ram, 2 shears and over—1, John H. King; 2, Cephas Nunn.

Shearing Ram—1, Albert Boswall.

Ram, Lamb—1, 2 and 3, John H. King & Son.

Ewe, 2 shears and over—1, 2 and 3, John H King & Son.

Shearing Ewe—1, 2 and 3, John H. King & Son.

Ewe Lamb—1, 2 and 3, John H King & Son.

Aged Pen—1 and 2, John H. King & Son.

Pen Lambs—1, John H. King & Son.

Suffolks.

All prizes in the Suffolk class were awarded to Horne Bros., without competition.

Grades—Long Wool.

Pair Ewes, 2 shears and over—1, Albert Boswall; 2, W. F. McGibbon.

Pair Ewes, shearing—1, Albert Boswall; 2, W. F. McGibbon.

Pair Ewe Lambs—1, Albert Boswall.

Pen—1, Albert Boswall.

Grades—Medium Wool.

Pen—1, W. F. McGibbon.

Fat Sheep.

Ewe, over 1 year—1, John H. King; 2, Albert Boswall; 3, Cephas Nunn.

Ewe Lamb—1, Cephas Nunn; 2, Albert Boswall.

Haley & Son Special Prizes.

Best Ram Fleece—1, Albert Boswall.

Best Ram Mutton—1, J. R. Semple & Son.

Best Ewe Fleece—1, Albert Boswall.

Best. Ewe Mutton—J. H. King & Son.

Best Ram, any fleece type, pure bred—Albert Boswall, French Fort, P. E. I.

Ram, mutton type—J. R. Semple & Son, Truro.

Ewe, any fleece, pure bred—Albert oBswall.

Ewe, any mutton type, pure bred—J. H. King & Son, Sussex, N. B.

Ganong Bros. Ltd., Special Prize.

Best Jersey Bull, any age—1, J. R. Semple & Son.

Jersey Heifer, 2 years or under—1, J. R. Semple & Son.

Jersey Calf, 6 months old or under—1, J. R. Semple & Son.

The St. Croix Courier's Prize

Silver cup to the owner of the best individual bull without regard to breed—Miss Van Horne, St. Andrews.

French Canadian Bull, 3 eyars old—1, Miss Van Horne. Dry Cow, 3 years or upwards, W. S. Poole, St. Stephen.

Any other pure breed of Dairy Cattle—Brown Swiss—All prizes in this class awarded to Ralph H. Libby, Stanstead, Que.

The Makers of Surprise Soap Special Prize.

Best bull, any pure breed beef type—Horne Bros., Winsloe, P. E. I.

Best Cow of any pure bred beef type—1, Horne Bros.

Best Calf, either sex, beef type, six months old or under—Horne Bros.

SWINE.

Improved Berkshires.

All prizes in this class awarded to J. R. Semple & Son, Truro, N. S.

Improved Yorkshires.

All prizes in this class awarded to Fred T. Lever, Rollingdam Station, N. B.

Any Other Breed.

Board, 2 years—1, Ralph H. Libby, Stanstead, Que.

Boar, under 6 months—1, W. S. Poole, St. Stephen, N. B.

Sow, 2 years—1, Ralph H. Libby; 2, Albion Moffatt, St. Stephen.

Sow, over 1 year, under 2—1, Albion Moffatt.

Sow, under 6 months—1, 2 and 3, Ralph H. Libby.

Sow with Litter—1, Ralph H. Libby.

Boar and 3 Females—1, Ralph H. Libby.

Fat Pigs.

Fat Hog—1 and 2, Thomas McDonald.

Fat Spring Pig—1, H. D. McKay, St. Stephen.

Grades.

Sow over 2 years—Moffatt Bros., St. Stephen.

Breeding Sow with Litter—1, W. F. McGibbon, Moore's Mills; 2, Melbourne Reynolds, St. Stephen.

Special prizes open to Members of Boy Breeders Clubs in New Brunswick—Yorkshire Sow—1, Fred T. Lever, Rollingdam.

Best Sweepstakes Boar, Oak Hall Special Prizes—1, J. R. Semple & Son; 2, Ralph H. Libby; 3, Fred T. Lever.

Fat Pig, any breed—1, Thomas McDonald.

F. Walsh, Judge.

HONEY AND APIARY SUPPLIES.

Honey and Bee Supplies, and Bee Products.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.
Contract rates on application.

SEPTEMBER 28.

THE FARMER VS. MANUFACTURER

Agriculture is one of the industries that has never been put on a sound financial basis. Unlike men engaged in other lines of occupation, the farmer has never been able to get out of his business actual cost, plus reasonable margin or profit. And for this condition of affairs he has no one else to blame but himself. The trouble lies at his own door, and until he faces the issue squarely and fairly, there is not likely to be much of a change for the better.

When the manufacturer starts an industry his aim is to make it pay dividends, and that same thought should be uppermost in the mind of every farmer, whether he toils as a tenant or freeholder. The manufacturer invests his capital, starts the machinery in motion, turns out his wares, and then quietly sits down and figures out the cost of production, before he attempts to do any marketing. Then he adds a certain percentage to cover overhead expenses, and in addition, sufficient to reimburse him for the amount of money he has put into the business. His goods are then ready for the market, with his financial protection practically assured.

Now what about the farmer? Is he not a manufacturer in the same sense of the word, as is the man who turns out clothing, machinery, or any other commodity that might be named? Most decidedly. The agriculturist is a manufacturer of both raw and finished products. He must invest capital in exactly the same way that any other man does who turns his attention to industrial business. The manufacturer with his money buys land, puts up a building, equips it with machinery, engages his expert help and then proceeds to business. Does not the farmer have to do the same thing? Certainly. He makes a purchase of land, erects his house and barns, buys his livestock, and then starts operations. Up to this point both farmer and manufacturer have to all intents and purposes made precisely the same start in their business career. But unfortunately it ends there. Their methods of doing business from now on assume entirely different aspects. The one, as has already been pointed out, follows a course that leads to progress and advancement, yes, and safe assurance of compensation, while the channel taken by the farmer is diametrically the opposite. He does not know what it has cost him to produce his products of the field and stable, he figures nothing on capital invested, in many instances his own labor and that of his family is thrown in, and he goes into the market to sell his goods, with the result that he takes just what the middleman is willing to allow him, regardless of what should be paid according to the law of supply and demand.

But the argument comes back that notwithstanding all that has been said to the contrary about the farmer and his methods of doing business, scores of them are making money, in fact rolling in wealth, as Dr. J. H. Grisdale, Deputy Minister of Agriculture, saw fit to term it some time ago. Of course, many of them are making money. No sane man would argue differently. But the point we have in mind is that the great majority of farmers are not making the same return for capital invested that falls to the privilege of other classes. The farm survey investigations being conducted by Prof. Leitch, of the Ontario Agricultural College, are proving this to be the case. When farmers with a capital of anywhere from fifteen to thirty thousand dollars, invested in land and buildings in our most prosperous dairy sections, receive only five per cent. interest on investment, a free house, free milk and vegetables along with 32 cents per hour for his own labour, it is pretty good evidence that they are not being enriched to any undue extent. Moreover, this is all the more significant when it is taken into consideration that the life of the dairy farmer is one of long hours and great physical exertion, with little or no opportunity in these days of scarcity of good labor for recreation on his part or that of his family.

What is the remedy? Well, here is the answer given the other day by Past National Master Oliver Wilson in his address at the 53rd annual session of the United States National Grange:

> "The greatest need of agriculture from now on is neither subsidies, patronizing nor 'uplifting;' not further campaigns of investigation, literature or other superficial or useless camouflaging, all costing great sums of money, employing an army of non-producers at the expense of the public treasury, and all getting us nowhere. The time has come to simply classify agriculture as one of the great industries that make up our economic structure, and to treat it as one of the vital parts of that structure. This means such an adjustment of prices for farm produce, such a recognition of production costs, such a scale of hours and wages as will enable the farmer to run his business exactly as does the manufacturer of any other commodity—selling price to be based upon the cost of production, plus such reasonable margin as shall provide for depreciation of equipment, for interest on investment and for a fair profit over all.
>
> "When agriculture is thus classified, and thus rewarded, there will be no shortage of farm investors or farm workers, no scarcity of food and no need of any propaganda, either by Government or by anyone else, to 'popularize agriculture.'"

It seems to us that Mr. Wilson has touched a very vital spot, as a means to popularizing farming, which should commend itself to every thoughtful farmer whose desire is to put his business on a safe foundation, socially, financially, and otherwise. And the way to do it is, as Mr. Wilson says, through adopting some means of knowing what it costs to produce what we have to sell, and then through better organiation see that the selling price is worked out on that basis. Such a system would soon settle all controversies as to the selling price of milk, cheese, pork, fruit, in fact any commodity grown on the farm for sale, either for export or local consumption. Then why not give it a trial right now, when the farmers are in a mood for proper organization to protect their own interests?

THE WELL WATER SUPPLY

Impure well water is responsible for more sickness and disease than most people are aware. Its continued use leads to bowel disturbances, typhoid fever, and dysentery, affecting man and beast alike. Provision, therefore, for an adequate and satisfactory water supply is one of the prime necessities of life and the safe-guarding of that supply of equal importance.

Ordinarily, wells are exposed to contamination in two ways. The surface water, from rain, house slops, and barnyard drainage, may find its way into the well at or near the surface of the ground, or the ground water stream supplying the well may in its subterranean movements encounter cesspools or seepings from them, and carry with it soluble and suspended particles, some of which may enter the well.

In the selection, location and sinking of a well it is always a good idea to consider permanence in addition to safety. It should penetrate to a level below that of the ground water surface in the driest season and be located in such a position that the surface drainage from all possible sources of animal and vegetable contamination is away from it. The ground immediately around it should slope gently away and be paved if possible. The well itself should be so constructed that impurities can not get into it from above or the sides. If water can soak into it after passing through a few feet of soil only, it can not be regarded as secure from pollution. To prevent this the well should be provided with a water tight wall built of cement down to the water level. The outside surface of this wall should be covered with a thin layer of cement and clay pounded and puddled in around it.

If for any cause, there is reason to suspect that well water has become polluted, as it often does at this time of year, a sample should be sent at once to a chemical laboratory to be analyzed, which is the only way to tell whether it is pure or not, as there can be no dependence placed upon the color or general appearance of water. In this way you safeguard the health of your family and in the long run it is usually pretty cheap protection.

The mistake in small herds of selling the bull before the production capacity of his heifers is known too frequently occurs. Early disposal of the bull is usually due to the farmer not wishing to practice inbreeding to the extent of mating the bull to the bull's own offspring. Where a farmer has a neighbor who has a good bull of the same breed, and who also does not wish to inbreed, the situation is met by exchanging bulls In this way, young bulls, with good producing parents, can be conveniently kept until their production ability has been tested. Many bulls have been sacrificed at butcher prices, while, if they had been kept a year or two longer, or long enough for their heifers to show their milking capacity, they would have been worth five to fifteen or more times their value for meat.

The world is filled with good brains which have missed the opportunity of training.

HOW TO GROUND LIGHTNING RODS

In the installation of any lightning rod system, it is well to consult an expert. A very small point may throw the entire system entirely out of working and so invite lightning rather than prevent it. For instance, conductors of whatever kind should be installed in straight runs as far as possible, avoiding abrupt bends. Where bends are necesasry they should be rounding and never square or acute. Another precaution, never have the rodding on a building divided into two separate systems. This condition would likely cause damage in case of a stroke because the current might jump from one system to the other. As the cable on the side of a barn is liable to be disturbed by live stock, it should be protected by wooden strips nailed over the cable for some distanle above the ground.

Formerly it was thought necessary to have all connections between the rodding system and the building insulated. Glass or earthenware insulators were used. Now, however, it is found that a good electrical connection with the walls of a building facilitate the harmless discharge of the electricity into the ground. Copper nails and metal clips of various kinds are now used to fasten the rods securely to the walls.

One of the important features of any rodding system is the location of aerials. As a rule aerials should be placed not less than 25 feet apart, along a ridge or flat roof. Each elevated portion of the roof, such as chimney peaks, towers, gabel roof, etc., ordinarily should have one or more aerials. In locating aerials it must be kept constantly in mind that they must serve to direct the stroke of lightning and to silently discharge static electricity. Obviously, if they are imperfectly erected and liable to be blown over durig a storm they are worse than useless. The point of an aerial should be strong and durable. There is no particular advantage in several small points over one large one. In fact, the smaller ones are more likely to be fused by the lightning stroke. Copper or iron points are generally preferred because they fuse less easily.

Among the many important details in the establishment of a satisfactory rodding system, getting a proper grounding is perhaps the most important. Unless the rods have continuous connection with soil moisture, the system may be a fire risk rather than a protection. There are several rather important technical points to consider in the grounding of a rodding system. In the first place the rods must be buried sufficiently deep to insure the ends being permanently moist. Again, the area of contact between rods and soil must be sufficient to make possible an immediate distribution of the electrical charge. Sometimes, it is impossible to get the rods into permanent soil moisure, because of a bed of rock. nI this case it is not wise to do like one is reported to have done. He made the rod into a coil and buried it in the surface soil. This makes the entire rodding system worthless and even dangerous. In case rock interferes with the deep burial of the rods, it is best to run the rods horizontally for some distance underground. Several different materials make satisfactory grounds. Copepr plates, standard cable, water pipes and cast iron rods have been used successfully. The practice of making a small hole in the ground and inserting a portion of the same conductor this is used above the building is not advised. Another precaution to take is not to locate grounds where there is manure. The ammonia will attack the rods, especially copper, and in a short time, they will be useless. On the average-sized L or T-shaped building there should ge at least three grounds.

ENGINEER.

THE GRANGE ON POLITICS.

The United States National Grange has issued the following statement which is of interest to farmers generally:

"The Washington office of the National Grange has been called on several times to take part in political contests, either where present members of Congress are being opposed by so-called farmer-labor coalitions, or are being favored by farmer organizations.

"To all such calls there is but one reply, and this statement is issued that there may be no possibility of a misunderstanding, reiterating the substance of what was stated in a previous bulletin issued from this office two weeks ago. The Grange, whether in its subordinate bodies, its county, or its state, or its national organization, does not participate in partisan politics. The organic law of the grange prohibits a grange from taking part in political nominations or during its sessions discussing political candidates. This organic law governs the National Grange as well as the smallest subordinate grange. It applies to the grange in any and every organized form, and to every grange officer acting in a grange capacity.

"Guided by a clear understanding of this rule of conduct, the Grange has refused to enter into co-operative relationship with other organizations seeking political results, or with any labor organization. There are two reasons for this. First, the principle of refraining from political activities. Second, the clear belief of the Grange that just now labor organizations are guided by narrow motives of class selfishness, and led by radical leaders seeking political changes detrimental to the principles of our government, and to what the Grange conceives to be true Americanism.

"The principle upon which the Grange rule is based in this political action should grow out of unselfish consideration for the greatest good to the whole people; not the selfish interests of a class or group. The Grange as an organization, therefore, refrains from joining any partisan appeal, or any group coalition, and is opposed to principles and to candidates for any purpose other than the best interests of the whole public.

"Least of all will the Grange enter into the most objectionable of all political activities, the dealing and dickering between the parties, threatening class opposition, or playing one against the other, with the promise of influencing votes in large blocks to the party or the candidates who promise them most. That form of non-partisanship is the opposite of the principle which actuates the Grange, 'the greatest good of the greatest number.' It is deliberately calculated for the special benefit of the best organized minority. The Grange as an organization refuses to be drawn into partisan politics. Its individuals are left free, and are urged by every teaching of the order to exercise every privilege and vry duty of citizenship, and to do so in freedom guided by their own individual judgment.

"A newer generation not familiar with the history of the 'groundswell' of the seventies, or the 'Farmers' Alliance' of the eighties, is now active in public affairs. This wave of farmer activity in politics which is now at its crest is neither noval or different. The Grange has lived through two such experiences, witnessed the rise and wane of these efforts, measured their results, and has seen its own organization and membership weakened by the failure to achieve anything tangible. It is sound judgment, based on the 'wisdom of the past' that keeps the Grange out of politics now. History proves that the fraternal, educational, social, and co-operative efforts of the Grange win far more for country people and country life than political activity or political office. For fifty-three years the Grange has fought for wise legislation, for sound policies of government, and for honest and economical administration, willing to let the electors of the nation choose the men to make and administer the laws, without the attempted domination of any class, clique, or group of the citizenship."

THE SEED PROBLEM IN CANADA.

Canada requires each spring approximately 65,000,000 bushels of seed grain and 9,000,000 bushels of seed potatoes to sow and plant her fields. These amounts represent approximately 8 per cent. of teh average annual production.

The area devoted to these crops in Canada annually is approximately 41,000,000 acres. An increased yield of only one bushel per acre all round would mean an increase of over 41,000,000 buehels, or an addition to the wealth of the country of at least $80,000,000.

The four main ways of increasing production are: (a) By adding fertility directly; (b) by better cultivation of the land and following a proper system of rotation; (c) by adopting and following out the best methods of protecting the plants from insects and diseases; (d) by the more general use of seed of better breeding and of varieties better suited to the districts where grown.

The need for greater attention to the quality and variety of seed sown is becoming more generally recognized. Agencies already active in seeking to improve the seed situation are: (a) Experimental farms and agricultural colleges; (b) various enterprises conducted by agricultural extension services, e.g., field crop competitions, boys' and girls' clubs and contests, experimental unions, as in Ontario, etc.; (c) the Seed Branch of the Federal Department of Agriculture, and (d) the Canadian Seed Growers' Association.

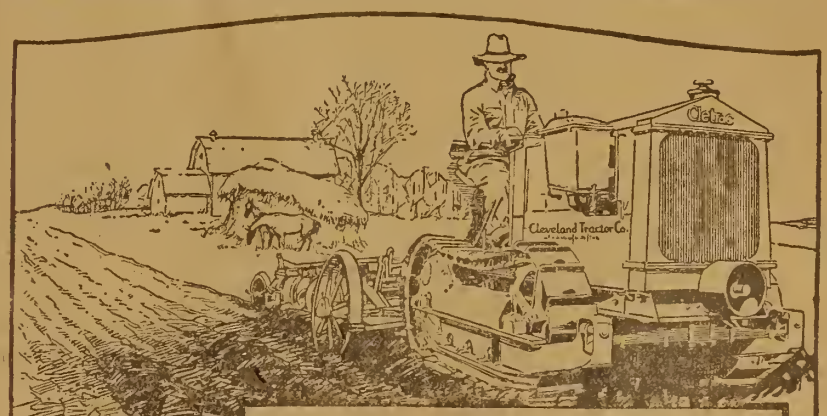
Full advantage should be taken of the growing tendency among farmers to study plant life and to try and produce more productive strains for their localities.

The most pressing problem at the present is that of making pure seed of suitable strains more easily available to farmers. The solution of this problem is being sought in the following ways:

(a) By encouraging organization of seed centres; (b) by improving marketing facilities; (c) by increasing the demand for good seed both in Canada and the United States; (d) by encouraging private enterprise and initiative; (e) by making the production of registerable seed an entirely practical proposition for any farmer whose location and system of farming permits it.

The production or isolation of improved varieties is carried on chiefly by experimental farms and agricultural colleges. Although the possibility of something better than we now have being produced by practical farmers is fully realized.

The encouraging of individual farmers to select plants which may mark the starting point of a superior strain is one of the two main functions of the Canadian Seed Growers' Association. The second function is that of supervising the propagation of improved strains in a large way and in a manner which will ensure that their purity and other industrial qualities may be maintained indefinitely—Synopsis of an address by L. H. Newman, Secretary, Canadian Seed Growers' Associaton, at the Conference on Conservation of Soil Fertility and Soil Fibre, held at the Fort Garry Hotel, Winnipeg, July 14th, 14th and 16th, 1920, under the auspices of the Commission of Conservation.



Cletrac
TANK-TYPE TRACTOR

Wheels on a track — the Cletrac way · take less power

A Job for Cletrac Every Day

Cletrac travels on its own self-laid tracks over any surface. Doesn't sink in or pack the soil.

Threshing done, Cletrac is hustling along Fall plowing at just the right speed—the speed that means furrows turned right over, soil thoroughly pulverized, and trash buried deep. Cletrac plows close up to fences and turns short to get at the corners.

Cletrac tackles the whole Fall program of hauling and belt work—every job that requires the belt or a sure pull, is Cletrac's job and every day is Cletrac's day.

Cletrac is most economical on fuel; works perfectly on coal oil, (kerosene). Easily replaces six horses and saves on cost and keep. Cletrac requires no feed when idle.

Write for booklet—"Selecting Your Tractor." It has started many a man on the road to farming success.

THE WOODSTOCK EXHIBITION.

(Continued from page 907.)

Driving Horses.

Mare or Gelding—1, Chas. Palmer; 2, Harry Corey, Woodstock; 3, Warren Bull, Woodstock.

Matched Pair—1, H. C. Jones, Millville, N. B.

Mare or Gelding, driven by lady—1, Chas. P. Palmer.

General Purpose Horses.

Mare or Gelding—1 and 2, H. Hayden, Hartland; 3, C. H. Gray, Woodstock.

Matched Team—1, H. Hayden.

Agricultural Horses.

Brood Mare with Foal at Foot—1, F. Everett, Woodstock, 2, Donald Peabody; 3, Carey Dickenson.

Filly or Gelding, 4 years old—1, F. L. Hayden; 2, Chas. H. Gray; 3, Sam Keys, Woodstock.

Filly or Gelding, 3 years old—1, Chas. H. Gray.

Filly or Gelding, 2 years old—1, Wilfrid Budd, Woodstock; 2, Chas. Palmer.

Filly or Gelding, 1 year old—1, Carey Dickenson.

Foal of 1920—1, Donald G. Peabody; 2, Carey Dickenson; 3, Frank Everett.

Span—1, E. Avery; 2, F. L. Hayden; 3, H. Palmer.

Heavy Draft Horses.

Brood Mare with Foal—1, Howard S. Kearney, Southampton; 2, Warren C. Bull.

Matched Team, 4 years old and upwards—1, Samuel Keys.

Filly or Gelding, 4 eyars old—1 and 2, F. L. Hayden; 3, Chas. P. Palmer.

Filly or Gelding, 3 years old—1, C. H. Gray.

Filly or Gelding, 2 years old—1 and 2, Chas. P. Palmer.

Span Geldings or Mares, 3 years old—1, Chas. H. Gray.

Span Geldings or Mares—1, Harry Corey; 2, F. L. Hayden.

Hauling Match.

Team over 2800—1, Uraf Rhoda, Hogdon, Me.; 2, Frank Hayden; 3, Warren Hall, Grafton.

Team under 2800—1, Herb Lindsay; 2, Sam Keys.

Single Horse over 1400—1, Chas. Palmer.

DAIRY CATTLE.

All prizes in the Ayrshire class were awarded to McIntyre Bros., with the exception of 1st on aged bull, 2nd on Jr. Yearling, 2nd on Senior Calf and 2nd on Junior Calf, which went to Clover Nook Stock Farm, Hartland.

Brown Swiss.

All prizes in this class were awarded to W. A. Jolly, Waterloo, Que., with the exception of 1st prize for Heifer Sr., and 1st prize for Bull Sr., which went to Dr. Griffin, Woodstock, N. B.

Holsteins.

Bull, 3 years and over—1, Harding Bros., Welsford, N. B.; 2, Edwin Robinson, Windsor, Ont.; 3, C. S. Smith, Woodstock; 4, John W. Purvis, Woodstock.

Bull, 2 years old—1, Harding Bros.; 2, Earl Phillips; 3, F. Edwards, Lower Millstream, N. B.

Bull, Sr., 18 months, under 24.—1, Clover Nook Stock Farm; 3, Frank Edwards.

Bull, Sr., 12 months and under 18 months—1, Harding Bros.; 2, Warren C. Bull, Woodstock.

Bull Calf under 12 months, over 6—1, Harding Bros.; 2, Frank Edwards; 3, B. H. Avery, Plymouth, N. B.

Bull Calf under 6 months—1, Harding Bros.; 2, Frank Edwards; 3, Warren C. Bull.

Cow, 4 years and over—1, Harding Bros.; 2, Clover Nook Farm; 3, John W. Purvis.

Dry Cow, 4 years and over—1, Harding Bros.; 2, Clover Nook Farm; 3, F. Edwards.

Cow, 3 years old—1, Harding Bros.; 2, C. L. Smith; 3, Herb. Lindsay, Woodstock.

Dry Cow, 3 years old—1, Harding Bros.; 2, F. Edwards; 3, Clover Nook Farm.

Heifer, 2 years old—1, Harding Bros.; 2, Harding Bros.; 3, Warren C. Bull.

Heifer, 2 years, in milk—1, F. Edwards; 2, Clover Nook Farm.

Heifer, Sr., 18 months, under 24—1, Harding Bros.; 2, H. Palmer, Woodstock; 3, C. L. Smith.

Heifer, Jr., 12 months, under 18—1 and 2, Harding Bros; 3, J. W. Purvis.

Heifer Calf, 12 months, over 6—1 and 2, Harding Bros., 3, F. Edwards.

Heifer Calf, under 6 months—1 and 2, Harding Bros., 3, C. L. Smith.

Herd, 1 Bull, 4 Females over 2 years—1, Harding Bros.; 2, F. Edwards; 3, Clover Nook Farm.

Young Herd, 1 Bull, 4 Females—1 and 2, Harding Bros.; 3, F. Edwards.

Three Animals, any age, get of one sire—1 and 2, Harding Bros.

Three Animals, any age, progeny of one cow—1 and 2, Harding Bros.

Bull and 3 of his get—1, Harding Bros.; 2, J. W. Purvis.

Cow and 2 of her offspring—7, Harding Bros.; 2, C. L. Smith.

Jerseys.

All prizes in this class were won by E. de F. Holden, Freleighsburg, Que., with the exception of 1st prize for Bull Sr., and 2nd prize for Cow 3 years old, which went to A. J. Raymond, Woodstock, and 3rd prize for Heifer Calf over 6 months and under 12, which was won by Manzer Clarke, Woodstock, N. B.

Dairy Test.

Cow, 48 months old and over—1, Harding Bros; 2, E. H. Holder; 3, Warren C. Bull.

Heifer, under 48 months—1 and 2, Harding Bros.

Beef Grades.

Heifer Calf—1, H. C. Cochrane, Victoria, N. B.

Dairy Grades

Cow, 4 years and over—1, F. Edwards; 2 and 3, Warren C. Bull.

Cow, 4 years old—1, F. Edwards; 2, H. Palmer.

Cow, 2 years old—1, H. Palmer.

Heifer, 2 years old—1, Almon Boswell, Dunstaffnage, P. E. I.

Heifer Sr.—1, Warren Bull.

Heifer Jr., 12 months—1, Warren Bull.

Heifer Calf over 6 months—1, F. Edwards.

Heifer, under 6 months—1 and 2, Dr. Rankine, Woodstock.

Female, any age—Diploma, F. Edwards.

Canadian Bankers special, open to girls and boys under 17 years—Calf, 1, J. Bull, Woodstock.

Specials—Open to Purebred Holsteins

Holstein-Friesian Cow, 48 months and over—1, Harding Bros.

Holstein-Friesian Heifer under 48 months—1, Harding Bros.

BEEF BREEDS.

Shorthorns.

Bull Calf over 6 months, under 12 months—1, H. C. Cochrane, Victoria, N.B.; 2, F. B. Carvell, Woodstock.

Bull Calf under 6 months—1, Chas. P. Palmer; 2, Shaw Bros., Hartland; 3, B. Carvell.

Cow, 4 years and over—1, 2, 3, F. B. Carvell.

Heifer, Jr., 12 months, under 18 months—1, 2, F. B. Carvell; 3, Chas. P. Palmer.

Heifer Calf under 6 months—1, H.C. Cochrane; 2, Chas. P. Palmer; 3, F. B. Carvell.

Herd, 1 Bull, 4 Females—1, F. B. Carvell.

Bull and 3 of his get—1, Chas. P. Palmer; 2, F. B. Carvell.

Cow and 2 of her offspring—1, H. C. Cochrane; 2, F. B. Carvell; 3, Chas. P. Palmer.

Massey-Harris

Harvesting the Corn---Right

No need for anxiety about getting your Corn when it is "right" if you use a Massey-Harris Corn Binder. Its reliability allows you to wait till the Corn is just right for it gets it in quickly and without fear of being late. Cut too early it would affect the grain, and if too late it would lessen the feed value of the stalks, so with the Massey-Harris Corn Binder you get the Corn at its best.

It is easy to handle, and so constructed as to give perfect balance, which makes for an even and light draft, with no neckweight. Strong, the Main Frame being entirely of Steel, in one piece. Powerful, cuts all kinds of Corn with ease. Corn is carried to Knotter by Chains with Automatic Conveyor Fingers, which handle it as gently as human hands. No Packers to knock off the ears.

The Tripod of Ready Roofing

There is much more to ready-roofing than appears on the surface. You can't judge a roofing by its looks alone.

The three principal elements of ready-roofing—felt, saturant, and coating—may be compared to a tripod. This tripod supports the quality of the roofing. If one leg fails, quality suffers. When you buy Ru-ber-oid you know that no flaw will develop and a leaky roof result. The tripod which supports Ru-ber-oid Quality is sound at every point. Briefly, here are the facts:—

Felt
The backbone of ready-roofing is felt. Upon its quality, primarily, depends the life of the roofing. Because of this fact The Standard Paint Company of Canada makes, in its own factory, the felt which goes into Ru-ber-oid Roofing. This important work is intrusted to no outside concern. We know that only materials of the highest grade are used in the making of our felt.

Saturant
The saturant, properly compounded and applied, preserves the felt and will remain unchanged for many years. *It will not evaporate.*

The saturant used in Ru-ber-oid is composed of the highest grade of bituminous materials. It is forced into the felt under heat so that every pore is filled. *It stays where it is put; it cannot evaporate.*

Coating
The function of the coating is to seal in the saturant. Ru-ber-oid coating compound is a special mixture of animal and vegetable matter compounded with high grade asphalt. These materials can be mixed in many combinations but the one used for Ru-ber-oid will last longest without becoming hard or brittle, peeling, powdering, blistering or drying up.

DAIRYING.

DAIRY COW MAKES FARMING PAY

Every farmer where conditions will admit at all should not only produce raw material, but should manufacture that raw material into as nearly a finished product as he can with profit, for in this is his opportunity to make the most of his farm. Live stock is the machinery used in the farm factory, and food is the main product, but there are by-products as well. Wool, leather, and fertilizer are all important by-products of the farm factory.

For every pound of concentrates grown on the farm nature produces many pounds of roughage. While a portion of the concentrates may be directly converted into foood, and is sold for this purpose, none of the roughage may. It is a question of employing stock to convert these materials into food or simply to use them as fertilizer. Now when it is learned that live stock will make use of these materials, and yet put back in the manure an average of 80 per cent. of the fertilizing value, and that in a form much handier and more available, we can see that it pays to make use of them.

The cow ranks first as a converter of roughage into foood, and she will produce more food from the same weight of material than any other farm animal no matter what kind of feed it is. The hog ranks next, but with this very important difference—the cow consumes more roughage than concentrates, while the hog reverses this. Even without this the cow yields one-half more for the food, pound for pound.

The Independent Farmer a Dairy Cow's By-product.

The cow on the farm comes the nearest making the farmer independent of the conditions over which he has no control than any other one factor within his reach. With a herd of Holsteins that will convert all his feed into milk and a flock of hens and a bunch of brood sows to help take care of the separated milk and follow the cows, ordinary market fluctuations and transportation troubles will not worry the farmer, for his factory is running with room for a pretty good margin in tsese things. With a careful preparation for labor saving in buildings and equipment this problem will not be so threatening either. These days we can make our cow barns so nearly automatic in operation with the use of electric power, now within the reach of almost every farmer, that the hired man cannot hold much of a club over us.

Probably one of the greatest values of the dairy on the farm is the soli improvement bound to follow. Alfalfa and sweet clover are two of the most productive forage plants, rich in protein, and making a rich manure, and exceptionally valuable for feeding cows for milk production. Not only this, but they in themselves build up the soil. Silage with the grain in it, and alfalfa hay is the ideal ration, and rough pastures in sweet clover supplement these.

While ordinary crops fed to the dairy cow and the manure returned to the soil would gradually deplete the soil because of the presence of plant food not returned in the manure, these legumes take so much fertilizer from the air in the form of nitrogen and store it in the roots that this tends to balance the loss from feeding. Then when to this is added the regular supply of new plant food made available from nature's storehouse, it is a question whether we might not really make a farm increase in productiveness without bringing to it from outside sources any other plant food at all. Still feeding concentrates from outside sources and growing more and more forage crops makes the soil improvement more rapid, and this improvement in turn adds to the amount of silage crops and forage grown on the same acreage.

The dairy cow has paid off more mortgages, built more fine houses, and bought more bonds, than any other source of farm income. She is conservative, stable, and she and her product are subject to less chances of loss from strikes, panics, price crusades, foreign money markets, or any other of the hundred and one real or imaginary excuses for knocking the bottom out of values suddenly that keeps the farmer in hot water. She doesn't have to be marketed herself, and her product is regularly produced.

L. H. COBB.

FALL FEEDING MEANS GREATER MIL KFLOW.

Dariymen whose pastures are run down so that cows can just barely exist, have a tough winter's work ahead in order to catch up the lost condition. The extra winter feed required to make good what the cows lose by dry fall pasture is practically lost; an extra milk flow cannot be expected under such conditions. The method to get the steady milk flow and a healthy well conditioned cow, is to feed her well when pastures are failing.

When cattle are run down badly in flesh due to poor pastures it takes a long period of feeding in the fall and winter to make them regain their normal condition. All that time the farmer is paying the penalty, for his negligence, in extra feed and reduced milk flow. The breeder who keeps his herd coming along during the hot, dry summer months is the man who will reap the profit when the fall freshening and high priced milk is due.

Another serious condition often overlooked by farmers who allow their cows to run down in the summer is that a run down cow many times will produce a weak, unhealthy calf. Cows bred for fall calving are just far enough along in their gestation period to be most vitally affected by under feeding in August and September. The farmer must depend upon his calf crop for improvement and development. If he wilfully neglects his animals at this time he cannot expect his herd to become better.

It does not pay to negelct a herd in the fall months. A little feed at the right time often will save tons later on. Just watch the man who fall feeds this next winter. See if his checks are large and his calf crop stronger. Profit by his experience.

Now, if we wish to take advantage of the best results of progressive breeding for milk production we purchase purebred dairy cattle.

The efficiency of the cow as a milk-producing machine is mostly a matter of inheritance.

Soft as Down

AND warm as the coat of the maritime sheep from which they are made—Atlantic Underwear protects thousands of men from the icy blasts and piercing winds of a Canadian winter.

To wear Atlantic Underwear is merely to transfer the thick, warm, heavy woollen coat of maritime sheep to the back of the purchaser.

Atlantic Underwear will outwear any other line at the same price.

Its cut and fit is one calculated to satisfy the "hardest to please" customer. Try it—then lay in your winter stock.

BRITISH HOLSTEIN MILK YIELD RECORD.

The remarkable progress made during recent years in Britain in the development of dairy cows generally is emphasized by the wonderful yield of Mr. G. Holt Thomas' British Holstein cow Colton Secret III., that has given under official test, 1$5¾ lb. of milk in 24 hours. The previous best daily yield of any British cow was 101 lb., given by Mr. F. B. May's famous 24,130 lb. British Holstein cow Eske Hetty, now the property of the Olympia Agricultural Company, of Sudbourne.

Colton Secret III., which was purchased for the Northdean herd at Mr. Hugh Brown's record-breaking Colton sale last November, was stripped dry in the presence of officials and independent witnesses at 10 p.m. on the evening prior to the test, and she then gave 30¼ lb. milk. The milk of the ensuing 24 hours was taken for trial, wit hthe following results:

	Weight of Milk.	Weight of Fat.
6 a.m.	30¼ lb.	.78650 lb.
2 p.m.	43¼ lb.	1.21100 lb.
10 p.m.	32¼ lb.	1.12875 lb.
Total ..	1$5¾ lb.	3.12625 lb.

The average of the three butetr fat tests was 2.96 per cent., and the percentage of butetr fat, calculated by dividing the weight of fat by the weight of milk, was 2.96 per cent.. The day of test was unfavorable, being cold and wet. For 31 days since calving on 15th March last, Colton Secret III. has averaged 84¼ lb. milk.

She is being fed a concentrated food ration composed of 3 of ground oats, 2 of bran, 2 of linseed cake, 1 of barley, and 1 of decorticated cotton cake. In addition, she receives silage, meadow hay, and roots.

CAUSE OF GARGET AND ITS TREATMENT.

It is generally believed that garget, mammitis or inflammation of the udder are winter and spring troubles with cows, but they may occur at any time. It is most prevalent, of course, when most of the cows freshen, and that is in spring or autumn, but it likewise occurs and is very troublesome on many farms during the hottest season of the year when grass tends to become bare and brown and flies are most pestiferous in their attacks. If it is borne in mind that any cause of sudden impairment of the circulation of blood away from the udder may end in garget, it will be more easy to understand summer attacks of the disease. The liquid ingredients of milk come directly from the blood and largely at the time of milking. Blood engorges the mammary gland in preparation for elaboration of milk. The solids, mainly butterfat and casein, are formed in the tiny milk cells or acini of the gland.

Shock or chill tend to cause stagnation of the blood and serum then flows into the tissues and distends the udder. That is the cause of acute congestion of the udder just before or after calving. When circulation is perfectly established congestionq subsides. Should it continue garget or inflammation occurs. Infection by germs, associated with other causes, results in the worst forms of garget which are likely to ruin attacked quarters of the udder for milk secretion. In hot weather cows often run wildly to escape torture of flies.

They heat themselves accordingly and should they then run into cold water, as often happens, chill and disastrous stagnation of blood circulation in the udder is bound to occur. Chasing by dogs, followed by standing in water or lying upon cold, wet ground, hsa a similar effect. Chill from sudden exposure to the cold summer thunderstorms is another cause. Chafiing of the distended udder between the thighs when the dairy cow is made to run on the way to the stable at milking time, or is chased by a dog at that time, is another but unsuspected cause. Lying upon bare cement floors when the udder is hot and distended also induces garget in summer. Flies clustering on the milk-wet tips of teats also carry infection and may set up the most disastrous forms of garget. So far as possible prevent such causes. Milk every two hours when a case is noticed. Massage well each time, Foment with hot water for 15 minutes every two hours, in severe cases. Once or twice daily, according to the severity of attack, rub in a mixture of one dram each of pure turpentine and fluid extracts of belladonna to the ounce of sweet oil, or melted lard, used warm. In severe cases prefer a mixture of equal quantities of camphorated oil, carbolized oil and compound soal liniment.

Ford
Touring Car
NATURE'S loveliest beauty spots, her choicest hunting grounds are far removed from the railroads, away from the much-travelled highways. Only a car of light weight and unusual power can traverse bad roads and marshy lands in safety. The Ford surmounts all road difficulties and takes you where you want to go.
The Ford Touring car is equipped with every modern refinement—one-man top; sloping double ventilating windshield; demountable rims, tire carrier and leather door grips. The horn button is mounted on top of the steering column and the headlights are equipped with approved non-glare lens. Electric starting and lighting equipment is furnished if desired at a slight additional cost.

HOW SOME COWS FOOL YOU.

Anybody who has ever milked a cow for a year or even a few months at a time, knows that some cows start off with a big bucketful, and after a month or two they drop off very badly, After five or six months they don't give enough milk to pay for the trouble of milking them. Such cows, however, are so noticeably lacking in persistency that it is not hard to find them out. The cow that drops off so gradually that you don't notice it, is the one that will fool you the worst. Without weighing the milk one would not notice a difference of a quart or so between one milking and the next. Persistency is one of the biggest factors in making a good record, and it cannot be accurately kept trace of except by the scales and records, at weighing the milk once a month for several milkings.

AT LOWEST COST.

The greatness of a cow is not determined solely by the amount of milk she produces, nor by the high test of butterfat in her milk. Underlying this is the cost of production, which is daily growing more important to those who are looking for the greatest profits from their herds. Many dairymen now weigh the food consumed by the cows and are thus able to tell exactly which cow is producing at the lowest cost.

Dairying is a profitable industry if it is done along efficient and scientific lines, a thing that any farmer can do, and which costs no more than milk production by scrub feeding, with scrub cows, and by using a scrub bull. Get into the game for greater profit—feed, weed, and breed.

Farmers' Accounts

This bank began its career in 1832 when Canada was largely an agricultural country, and during the eighty-eight years of its life it has always given special attention to the care of farmers' accounts.

We pay interest on savings accounts, cash your cheques, take care of your notes and make collections when due.

Business conducted by mail if necessary.

SHERBROOKE AWARDS OF A MARITIME BREEDER.

Following are the awards captured at the recent Sherbrooke exhibition by Harding Bros., Welsford, N. B.:

2nd, Aged Bull.
2nd, Two-year-old Bull.
3rd, Senior Bull Calf.
2nd, Junior Bull Calf.
4th, Three-year-old Cow, dry.
1st, Two-year-old Heifer, dry.
1st and 3rd, Senior Yearling Heifer.
4th, Junior Yearling Heifer.
4th Senior Heifer Calf.
1st and 2nd, Junior Heifer Calf.
1st, Aged Herd.
3rd, Young Herd.
2nd, Herd of Four Calves bred by Exhibitor.
2nd, Get of Sire.
1st, Progeny of Cow.
Junior and Grand Champion Female.

VALUE OF LIQUID AND SOLID MANURE.

Farmers should save every pound of manure, liquid and solid. In intrinsic and market value barnyard manure is considerably higher than it was a few years ago, and is invaluable on the farm where it is produced. Sources of the three great essential plant foods, nitrogen, potash and phosphoric acid, whether as feed or straight fertilizers, are expensive. The price of acid phosphate is almost prohibitive, owing to various causes. Farmers who breed and feed live stock using as much as possible home-grown feeds are relatively more favorably situated than heretofore for obtaining their sources of plant food, compared with the exclusive grain-farmers. Notwihstanding the present high prices obtained for grains, the growers are finding the apparent advantage offset if they mean to replace those essential elements of the soil which they ship from the farm with each crop. The most up-to-date farmers have an underground tank or cistern connected with their cattle barn and stable drains. Sixty per cent. of the fertilizing ingredients of the feed eaten is contained in the liquid portoin of the manure, and those farmers who have no cistern to collect it should see to it more than ever before that sufficient straw or other absorbent is used for bedding. The fertility of farms where live stock enters largely into the operations can be distinguished at a glance in most districts from the apparent fertility of the land, and under presnt conditions this compartaive advantage over the grain-grower is bound to be more marked. Clovers and alfalfa, along with good live stock, are the things to enrich and preserve the fertility of farms.

THE PROPER CARE OF BREEDING BULLS.

The fact that most aged bulls must be kept confined in the barn or paddock a large part of the time is reason sufficient why they should have comfortable quarters that are clean and well supplied with pure air and sunshine. The dairy farmer who invests a large sum of money in an improved sire to build up the milk-producing qualities of his cows can not expect him to bring about the desired results unless he gives him plenty of oportunity to perpetuate the good qualities he has inherited from his superior ancestry.

It is plain to see that most dairy farmers keep young, immature bulls simply because they lack convenience to handle an aged animal or else are afraid to care for and lead him out when his services are needed. For this reason much of the good blood which might have been used to build up excellent dairy herds has been sacrificed through ignorance and neglect. From calfhood on the bull should be well fed, cared for and trained. Good care and proepr handling will do much to combat the tendency to become cross and unruly. When about one year old he should have a ring put in his nose and as soon as the wound is healed, taught to be handled with a halter and staff. Always watch out for yourself and never permit a bull to get you in a tight place, for nearly all of the accidents with bulls might have been avoided, if the man who was handling them had taken proper precautions to protect himself.

Exercise is one of the most important factors in the handling of breeding bulls, and most often neglected than any of the others. Any cross bull or one hard to manage can easily be quieted and easily handled, if given plenty of exercise on a tread power.

106

With a tread power, a large bull can do many odd jobs, such as grinding, pumping, and running a fanning mill. Every good dairy farmer who invests in a pure-bred sire should invest in a god stal land tread power. With these comfortable surroundings and means of working off his surplus energy he will be healthier and more potent, because of the enforced exercise. The mere fact that comfortable surroundings and plenty of exercise make bulls potent, kind and quiet means that more dairy farmers can kep old bulls that have proved their ability to beget high-producing heifers. One of the most discouraging features of our daily farming is the fact htat so much good blood has been lost by selling some of the best bulls before their breeding qualities were known.

The bull should have an abundance of good, palatable feed, and experience proves that such feeds as clover, alfalfa and mixed hay, wheat bran and ground oats make an ideal combination. Some corn silage may be fed along with the above feeds, but many of the leading breeders of dairy cattle prefer to feed roots or green feeds in place of corn silage. The impotency of many breeding bulls has been due to feeding excessive quantities of corn silage and not enough proteinaceous feeds. L. J. M.

YORKSHIRE SOW SELLS FOR $3,780.

The most remarkable prices for pigs ever realized in Britain was obtained at a recent sale at Delmeny Home Farm, near Edinburgh, Scotland, when the second home sale of Lord Rosebery's famous stock was held. The average prices realized for Yorkshires and Middle Whites quite overshadowed any previous sale of these breeds. At the same time a world's record price was made for a pig of any breed, a Yorkshire sow bringing the extraordinary figure of $3,700. The former highest price for a pig was $3,685 for a Large Black.

The record-priced sow—63,700—was Dalmeny Mana 2nd, a two-year old sow by the Highland Society champion boar, Jellico, and in pig to Bourne Emperor. She was the first prize winner at the Highland Society's show last year.

There was a quieter demand for the Kerkshires, the top price being $390, for the two year old sow, Lothian Hepsy.

The following were the averages:

	Average.	Total.
49 Yorkshires	$465	$22,790
33 Middle Whites	330	10.990
16 Berkshires	210	3,460

DO NOT TRUST BULL.

There is scarcely a farmer who does not have personal acquaintance with men who have been injured by bulls. In every neighborhood there is found some person who has suffered broken bones or painful hurts from attacks by animals, many of which had been considered perfectly kind and trustworthy up to the time of the attack.

In the fact of all this knowledge, it is nothing less than wicked for a man to take chances or permit his children or his hired men to take chances with a bull no matter how kindly the animal has always appeared to be.

Familiarity breeds contempt and after the herd sire has been handled for a few months without showing any viciousness, it is an easy habit to get into to disregard the ordinary precautions in feeding or handling him. It is better to be safe than to be sorry, is a good maxim, and it ought to be a positive rule on every farm that each person who has anything to do with the bull must never approach him without using every means for safety that is at hand.

Stock breeders will testify that there is no trusting a bull; that one may appear kindly and affectionate or stolid for a whole year and then apparently without reason, suddenly become vicious. You can not take chances with him.

ALWAYS BURN BODIES OF DEAD LIVE STOCK.

On any farm it is extremely dangerous to leave the carcasses of dead animals exposed, and particularly so, if the animal has died from some contagious disease. Germs are carried by birds and animals that prey on the carcass annd in this way hog cholera, anthrax and other serious live-stock maladies are spread. The safest method is to burn all animals dying of contagious disease. The following method is recommended by a live-stock authority:

Dig a trench 18 inches deep and the length of the carcass. Place iron bars across the trench and roll the animal on. Cut a number of slices in the body. Place some wood and hay in the trench. Pour about a half gallon of kerosene over the animal, letting it run down into the trench. Put a layer of hay completely over the carcass, then a thick layer of manure, another thin layer of hay and last a thick layer of wet manure. Make a fire break around the carcass and then set a match to the hay in the trench. The burning will probaly continue for several days, but upon investigation it will be found that nothing is left but ashes.

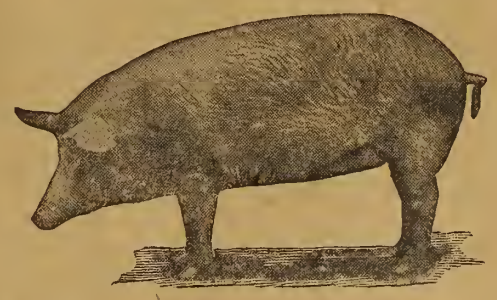
CLOSE GRAZING PASTURES.

Close grazing often endangers a pasture. That is one reason why the use of two or more small pastures are often better than one big pasture field, as it allows one to shift the live stock from one field to another when a rest of a week or two will be of great benefit and give the grass a chance to recover. If it has been necessary to thicken a pasture by sowing a little seed one will be better able to improve the stand by constant shifting of the stock. Permanent pastures may also be protected and made to yield better returns in most years by letting the stock pasture other crops when possible.

A few breeders have achieved a measure of success without patronizing fairs and exhibitions, but the number is so small as to be almost negligible.

Build Solid, Fine-flavored Meat on Your Hogs with EMPIRE Hog Feed

The right hog feed will not be wasteful by providing too much protein nor will it be over-economical so that there is not enough protein to secure the best results.



To arrive at a feed that will avoid both extremes is not easy, and means long, patient research and actual tests in experiments on the hogs themselves.

EMPIRE Hog Feed was not put upon the market until we were sure of its being perfectly balanced, tested and proven.

EMPIRE HOG FEED

Now, we know, and we offer this feed to hog-raisers with every confidence that it is the best for them to use. We are not trying to compete with low-grade feeds that are mixed to get down to a price. EMPIRE Hog Feed has its own standard—the highest—and while it costs a little more will positively yield big results.

"Costs More, but— It's Worth More"

ANALYSIS GUARANTEED

Protein, not less than.....16%

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price $1.75 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

The laws of the land are rather lenient in regard to the working of horses with sore shoulders or other parts where the harness bears heavily. Many horses have tender skin which is easily wounded, but in the majority of cases sore shoulders are directly due to negligence. If the collars fit properly and are kept clean, and the shoulders bathed and rubbed there is not much danger of bruised fresh or open sores. A real horseman is seldom found driving horses with bruised flesh or raw sores.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

Will reduce **Inflamed, Strained, Swollen Tendons, Ligaments, or Muscles.** Stops the lameness and pain from a **Splint, Side Bone** or **Bone Spavin.** No blister, no hair gone and horse can be used. $2.50 a bottle at druggists or delivered. Describe your case for special instructions and interesting horse **Book 2 R Free.**

ABSORBINE, JR., the antiseptic liniment for mankind, reduces **Strained, Torn Ligaments, Swollen Glands, Veins** or **Muscles; Heals Cuts, Sores, Ulcers.** Allays pain. Price $1.25 a bottle at dealers or delivered. Book "Evidence" free. W. F. YOUNG, Inc., 124 Lymans Bldg., Montreal, Can.

THE HORSE

THE MEMORY OF A HORSE.

While nursing a broken leg and crushed ankle unforgettable memories come crowding on me, one brought by my neighbor's riding in on a blaze-faced horse with glass eyes. I asked if the horse had a good memory. The owner said yes. Then I told him a story of my boyhood days:

In 1864 one of the Union soldier body, on being discharged at St. Louis, bought the mare which he rode in the service in Missouri, for he was greatly attached to her, and rode her home to woodford Co., Ill. We called her Queen, she was such a beauty and went so strong under the saddle and was so gentle. In the fall of 1870 my oldest brother moved from Woodford county to what is now Cowley Co., Kans. I, a lad of 17, drove one team, of which Queen was more than half as she always had her stay chain stretched. We crossed the Mississippi at Quincy, passing through Paris, but falling in with some undesirable travelers we turned almost due south toward Mexico and planned to cross the Missouri at Jefferson City instead of Boonville. Somewhere between Munroe City and Mexico and Paris the mare became very restless and fretful for several miles. My brother thought it my fault and gave me a round scolding. Finally he noticed that Queen wanted to turn at every road lteading to the right. Since it was about four in the afternoon and the mare was very hot, brother decided to camp.

At a wide lane leading up to a large, old-fashioned house we turned in. Brother took the water jug, went to the house and asked if he could camp there, explaining that he feared he had a horse with the colic. "Certainly, just drive in that little pasture lot and turn loose."

We fed the horses and were getting supper when an old gentleman from the house came to say "Howdy." Ae he talked t kept looking at Queen and finally said: "Stranger, that mare ain't sick. Fact is, you've got my mare and she is so glad to get home she can't eat."

He stepped up to her and called her a pet name. She whinnied and laid her nose on his shoulder.

"Now stranger, she's mine, and I am going to prove it to you. I would know her among a thousand, not only by her bald face and glass eyes, but because I raised and trained her, and know every dapple on her and the little wart on her left ear. She knows me and her name, and she ain't going away as long as she lives or I live."

Brother said, "I bought her for $125, got her second-hand from Uncle Sam."

"That's just it. The aYnkees stole her, they did. I'll prove it to you and that she is as smart as tacks. I will go to the barnlot gate and call her. You slip off her halter, and if she don't come to me on a gallop, reach over and unpin the door and go in the second stall you may have her; if she does she stays there, do you understand?"

Queen did exactly as he said and slept in her old bed the flist time for more than eight years; she did not forget. But there was gloom and little sleep in our camp that night. Early in the morning the old farmer came bringing a bucket of milk and about a gallon of honey. He said to brother, "Well, you did not slip out by mare and skin in the night so just make a good breakfast. But what are you going to do? You can't have my mare, that's certain. The Yanks stole her and well nigh every good thing we had, but one saddle stallion they didn't get because I was riding him."

So he talked until after breakfast was over. Brother offered to buy Queen or to pay him to let him have her without trouble or delay.

"So, sir, I can prove my property by all of the family who are left and my neighbors, too, and you can't have her, not at the end of the law. Stranger, you are in a bad fix sure, but you can't have her, no sir!

"See that bunch of colts over there, three- and four-year-olds. They never had harness on, but are of gentle, good stock. Pick out the one you want, but you can't have my mare."—Frank Darst, Garvin Co., Okla., in Breeder's Gazete.

Horses are well fed, as a rule, on the farm especially during the busy season, but the teams do not get the care that brings them out of the stable in the morning glossy and prancing. Heay wovrk horses are not disposed to do much prancing at any time, but the appearance of the coat and condition of the harness tells the tale. Farmers and their sons do not take the interest in their horses that was common ten or fifteen years ago. The horse is made a beast of burden and little more and much of the pleasure that can be derived from holding the reins over a "bang-up" good team is not sought after or experienced as it formerly was. It is unfortunate indeed when one looses his zeal for a good horse; the most intelligent and most faithful servant of man. The Boston Work-horse Relief Association, organized to improve the horses and give them better care in that munii-pality, has published a book in which are many hints and much good advice. The Stable Rules given by the association and published below are a good guide to teamsters and horsemen everywhere. They may not lend themselves to farm practice at all seasons, but they are sound in principle, and worthy of consideration:

Stable Rules.

1. The best order in feeding is: Water, hay, water again, grain.

2. Never give grain to a tired horse. Let him rest and nibble hay for an hour or two first. Grain in the manger before the horse comes in looks bad.

3. Water the horses as often as possible; but let the horse that comes in hot drink a few shallows only, until he is cool.

4. Always water the horse after he has eaten his hay at night. Do not go to ged leaving him thirsty all night.

5. Do not forget to salt the horse once a week; or, better yet, keep salt always before him. He knows best how much he needs.

6. Give a bran mash Saturday night or Sunday noon; and on Wednesday night also, if work is slack. After a long day in very cold or wet weather, a hot mash, half bran and half oats, with a tablespoonful of ginger, will do the horse good. Put very little salt, if any, in the mash.

7. If the horse does not eat well, or slobbers, examine his teeth.

8. Keep a good, deep, dry bed under the horse while he is in the stable, day or night, on Sundays especially. The more he lies down, the longer his legs and feet will last.

9. In order to do well, the horse must be kept warm. Give him a blanket on cool nights in late summer or early fall, and an extra blanket on an extra cold night in winter.

10. In cold rains do not tie up the horse's tail. The long tail prevents the water from running down the inside of his legs, and keeps off a current of air from his belly.

11. Take off the harness, collar and all, when the horse comes in to feed. He will rest better without it.

12. Never put a horse up dirty or muddy for the night. At least brush his legs and belly, and straighten his hair.

13. In hot weather, and in all weathers if the horse is hot, sponge his eyes, nose, dock, and harness marks, and the inside of his hind-quarters when he first comes in.

14. When the horse comes in wet with rain, first scrape him, then blanket him, and rub his head, neck, loins and legs. If the weather is cold, put on an extra blanket in 20 minutes. Change the wet blanket when the horse dries. Do not wash the legs. Rub them dry or bandage loosely with thick bandages. It is far more important to have the legs warm and dry than clean.

15. To prevent scratches, dry the horse's fetlocks and heels when he comes in, especially in winter; and rub on a little vaseline before he goes out in snow or mud.

10. Examine the horse's feet when h ecomes in, and wash them if he does not wear pads. If a horse in the city is not shod in front with pads, apply tar and oakum. It is absolutely necessary to keep his feet soft by packing them, or by wrapping a wet piece of old planket around the coronet, or by applying some hoof dressing or axle oil, inside and out, at least three times a week.

A Horse in the Fields is worth Three in the Stable

A horse that's working is paying for his keep. Three lame or sick horses in the stable are simply an expense From now on, you need your horses every day and all day. Get them in condition and keep them in fine condition, with

The time spent in preparing green feed for laying hens is well paid for in increased production. As to the milk the having has been a clear gain for we had no other use for it.

When the hens had all the milk they would consume and all the green feed they wanted we found that they ate approximately an ounce less of grain a day.

A MESSAGE TO WOMEN!!

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, post-paid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont

POULTRY.

HEN HOUSING HELPS.

The time is now at hand when poultry is no longer considered a necesary evil upon the farm. Most farmers now consider poultry a very profitable sideline in any farming business. With a realization of its value comes the realization that in order to make it profitable, poultry must be properly housed. proper housing does not necessarily imply elaborate or expensive buildings, but a few very important essentials must be borne constantly in mind by the poultry-keeper.

Winter eggs are an out-of-season product, as are fresh winter vegetables and hothouse strawberries. The truck farmer would never think of attempting to produce winter cucumbers, lettuce, tomatoes and strawberries without a heated greenhouse. Neither should we expect to produce winter eggs without providing housing conditions for hens which most nearly aproximate spring, the season of highest production. With the laying hen, proper housing conditions spell comfort and high production.

A few of the more essential features of the house which contribute toward the comfort of the laying hen are: Freedom from moisture, abundance of sunlight, plenty of room, protection from excessive heat and cold, ventilation and sanitation.

The damp, cold house saps the vitality of the fowls, lowers production and aids the spread of disease. The hen can elimnate moisture from the body only through the respiratory organs. A damp, cold atmosphere causes the fowl to be uncomfortable, breathe rapidly, pant, and finally to become completely exhausted. Fowls weakend or in an exhausted condition are easily susceptible to disease.

Sunlight is a good grmicide, helps to keep the house dry and warm, and therefore helps to approximate spring conditoins. Provision should be made so that he sunlight will strike all aprts of the house at some time during the day.

A hen too closely confined soon becomes restless and uneasy. Restlessness results in discomfort and the development of such vices as egg-eating, feather-pulling and cannabalism. There should be plenty of room in the house for proper exercise, not less than four square feet per bird in flocks of less than 100.

Sudden changes of temperature lower production. It is, therefore, necessary to protect the poultry house from north winds. This may be accomplished by locating it in the lee of another farm building, an orchard, or a row of trees. Shade should be provided for the fowls in hot weather.

Adequate ventilation helps to keep the house free from moisture. Plenty of ventilation without drafts keeps the fowls healthy and vigorous. When fowls are alolwed to roose in a draft, they catch cold easily.

Any poultry house should be so constructed that it may be easily cleaned and disinfected. Most common poultry diseases are highly contagious. Mites breed rapidly, and in houses which are hard to clean are extremely hard to eradicate.

It is also quite as essential to locate the poultry house where it will fit in to the routine of every-day farm work. It should be near enough to the other farm biuldings so that the care will consume a minimum of time and labor, and yet not be so near that the birds will be a nuisance.

Attention to these more important features of the subject of poultry housing contribute much toward success.

REMOVE MALE BIRDS FROM THE POULTRY FLOCK.

The presence of male birds in the flock during the summer months has a decidedly detrimental effect upon the quality of eggs and poultry producers lose many thousands of dollars annually through the presence of partly incubated and bad eggs in the produce they market. Reports are now being received from all parts of the country of the number of partially incubated eggs appearing in current receipts. Producers do not realize that it is unnecessary for a fertile egg to be placed under a broody hen to cause the germ to grow; a temperature of 70 degrees is sufficient to start incubation. If the heat is constant, the development of the chick will continue, but if it ceases or is intermittent, putrefaction at once sets in and the egg becomes bad. Such eggs have no place or value in shipments, and should they get to the consumer the

When Home Seems Good

A BLIZZARD OUTDOORS—warmth and comfort within. There is nothing in the home so necessary as a good furnace. Stoves and base burners are unequal to the task—they choke the air with dust and only warm parts of the house.

And buying a furnace is a matter of knowing how. The warm air heating system is the least costly. It is the most effective and healthful too. The

ENTERPRISE BLAZER WARM AIR FURNACE

will keep every corner of your home delightfully comfortable in all kinds of weather. It draws in the pure fresh air from the big outdoors, warms and moistens it and sends it on its way to you. Stoves and radiators can only heat the same air over and over.

Every part of the Enterprise Blazer Furnace is made just a little bit better than is necessary—the grate bars a little stronger—the fire-pot a little heavier. These are the things that enable us to guarantee that the Blazer Furnace will give you entire satisfaction.

Go fully into the matter with your dealer and write us for our free booklet "Warmth and Comfort"

The Enterprise Foundry Co.
Limited
SACKVILLE, N. B.
Makers of the well-known lines of Enterprise Steves, Ranges and Furnaces 22

consumptive demand immediately falls off.

The male bird is not essential in egg production; his usefulness is over when the supply of fertile eggs for the season has been secured. The hens will lay just as many eggs when the male bird has been removed and the eggs will be more suitable for consumption, packing of storing. Further, there is a distinct financial gain to the producer who markets infertile eggs, because the best trade in many cities offers a premium of from one to five cents a dozen for infertile eggs.

Then there is the question of feed. It costs money to feed pounlry, and with feed at its present value, the consumption of feed by males kept for no particular purpose is a serious waste. The reason for this is that the best prices for live and dresed fowl prevail in the spring and early summer. During the summer the price declines, and by the early fall when many producers decide to market their male birds, a lower price than prevailed in the spring has to be accepted; the producer thus losing the amount per pound the market has declined, plus the value of the feed consumed by the birds during the summer months. This financial loss takes on a more serious aspect when it is coupled with the amount charged back by the wholesaler for the bad and partially incubated eggs that have been marketed.

Farmers and others selling eggs for market should, therfore, need no urging to kill off, dispose of, or at least remove the male birds from the flock after the breeding season.

DOSING CHICKENS.

Slight cases of diarrhoea can be greatly benefited by adding a few drops of spirits of camphor to the drinking water; also add finely ground charcoal to the soft feed.

Nothing better than linseed meal for indigestion. Give a gill in the soft feed, to each dozen hens. A teaspoonful of fenugreek added to the mash for every 10 fowls is also a good remedy.

A pill made of a half grain of puinine, one grain of sulphate of iron and five grains of phosphate of lime, is just the thing for cases of leg weakness. A more simple remedy is 10 drops of tincture nux vomica in a quart of drinking water.

A pill of asafetida, about the size of a pea, given night and morning, is highly recommended for cases of limberneck.

When the fowl "rattles in the throat," it is evidence that there is some bronchial affection. This "rattling" will be more plainly noticed at night, while the fowls are roosting. Give a half teaspoonful, every morning, of a mixture composed of equal parts of vinegar and water. If this is not effective, treat with a mixture of one part of spirits of turpentine with four parts sweet oil, giving 10 drops daily.

There is no more effective remedy for scaly legs than to coat them with gas tar, allowing the preparation to remain on the legs until it wears off. The scales, as a rule, come off with the tar. To make a still more complete job of it, after the tar has worn off, is to wash the legs with warm water and carbolic soap, and after wiping dry apply a preparation of one-third carbolic acid to two-thirds glycerine. The glycerine has a tendency to soften and bring out the color on the shanks and toes that may have become harsh and dry.

A drop of glycerine is also a sovereign remedy for sore eyes.

Penmans Underwear

"THE STANDARD OF EXCELLENCE"

"NOT a flaw, my boy, not a hard thread! You will get no end of wear from that garment!"

Who is a better judge of woollens than Grandma? She has knitted nearly all her life. Judging materials was part of a young girl's training in her day.

Grandma readily recognizes the quality in Penmans underwear.

174

FEEDING FOR EGGS.

In order to obtain an abundance of eggs it is necessary to have healthy, vigorous stock, properly fed.

The following are good grain mixtures for the laying stock, the proportions being by weight:

Ration One—Equal parts of cracked corn, wheat, oats. Ration Two—Three parts cracked corn, two parts oats, one part wheat. Ration Three—Two parts cracked corn, one part oats.

A choice of any of these rations should be scattered in the litter twice daily, morning and evening.

Either of the following suggested dry mash mixtures should be fed in a dry mash hopper allowing the fowls to have access to it at all times.

Mash One—Two parts corn meal, one part bran, one part middlings, one part beef scrap. Mash Two—Three parts corn meal, one part beef scrap.

When fowls do not have access to natural green feed, sprouted oats, cabbage, mangels, cut clover, etc., should be fed.

When wet mashes are fed, be sure that they are crumbly and not sticky. Plenty of exercise increases the egg yield.

Fresh, clean drinking water should be always provided. Charcoal, grit, and oyster shell should be placed before the fowls so that they can have access to them at all times.

BREEDING MALE BIRD.

1. He should possess the characteristics and markings of the breed and variety of which he is a member.

2. Strong vitality.

3. Active movement.

4. Good health as indicated by ruddy combs and wattles.

(It is not advisable to use a bird for breeding which has ever had a disease even if there are no indications of it at present.

5. No marks of effeminacy. Crow should be strong and clear.

Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

Be satisfied and pleased with what thou art,
Act cheerfully and well the allotted part.
Enjoy the present hour, be thankful for the past
And neither fear nor wish the approaches of the last.
COWLEY.

"THE MOURNING DOVE"

The old Parr house had stood empty and been on sale so long that everybody on Pink street had become resigned to being stared at by its uncovered windows, which were like so many desolate eyes, and to wading over its unshoveled walk in winter. When finally the Town Tattler announced that it was sold there was a good deal of comment.

As it chanced, there was only one new neighbor, though she brought good furniture enough for a large family. Mrs. Orr followed close upon the furniture and for several days the house buzzed with the business of paperhanging, painting and getting settled.

Old Mrs. Foley called first. She was the oldest Pink streeter and she never allowed any one to rob her of her prerogative of setting the pace for others to follow. She took Miss Jessup with her and they came away charmed.

"You must go to see her," Mrs Foley commanded Jill Wing. "Now, don't hold off the way you usually do with newcomers in this town. Remember, she's now as much a Pink streeter as you or I. Go to see her and take your mother along."

So Jill took her mother to see Mrs. Orr. A maid admitted them to the parlor and left them to admire the new paper and the furnishings, which were so different from their own home shabbiness. Jill saw herself in the mantel mirror and realized suddenly that sponging and pressing wasn't going to keep the shine off her blue suit forever and that the muff she had contrived out of an old cape of her mother's had a wantonly home-made appearance. At least her mother's bonnet was quite fresh and becoming.

It helped matters somewhat. But then it ought to, for Jill realized that Cousin Fanny, who had sent the bonnet from the city, had paid a pretty penny for it.

At that moment Mrs. Orr entered. She was very small, very plump, very demure. She wore a simple gray dress of softest crepe de chine, which clung to all her curves tenderly. Her meek brown hair was plastered quaintly on her round, smooth forehead, underneath which large green-gray eyes looked in innocent questioning upon a still mysterious work.

When she spoke her voice was a soft, throaty murmur.

"My dear Mrs. Wing! And Jill!"

"Why—why, you are Dolly Box!" Jill stammered. "I never dreamed —I——"

Mrs. Orr squeezed Jill's hands and looked upon her fondly. "I've been dying to see you," she said. "I was quite sure you'd recognize me. You see, dear Mrs. Wing, Jill and I were classmates at Miss Sears' seminary. When dear old Dr. Bayne recommended this altitude for my asthma I remembered at once that Jill lived here. That fact did much toward reconciling me to isolation in the country."

She dropped into a deep chair.

As a result the first formal call lengthened unconscionably, and even at the last Jill had hard work to get her mother away.

Mrs. Wing was charmed with Mrs. Orr. "She's just a dear, sweet, gentle little thing. To think, Jill, she's younger than you, and yet she has been a widow eleven years! I hope she'll find some one here to marry, for she needs protecting if any one ever did."

Jill winced, for it was her mother's one grievance against her that she would not marry Joel Washburn, when she might any day. After several years of contemplating Joel as a would-be husband Jill was still not just sure of her feelings toward him. She liked him sometimes, she even admired his good nature, his big-heartedness, his strength and steady sobriety of purpose, but necessity had taught Jill to use the same caution in disposing of her future that she did in selecting her frocks; the one was scarcely like to last longer than the others. She would not be urged or coaxed into something she was not sure would be fair to Joel or right to herself.

"You must make a little party for Mrs. Orr, Jill," her mother planned, "and invite in all the people you think she'd like to meet—people like Joel and Lucia Hawver and Mrs. Van Dyke. You can get Helen Barr to help you serve and Mate Cody will do the catering. It will cost something, but I feel you ought to do it."

"I suppose you're right," Jill sighed. She thought of her gala attire—parts of two old dresses combined to make one. She had saved up money enough to get herself a new frock, but if it must go for entertainment for Dolly Box, why it must, that was all. There was nothing niggardly in Jill's nature.

So instead of getting a new dress Jill gave the party for Dolly Orr. All Pink street was there and several outsiders, including Joel Washburn. Mate Cody juggled cakes and hot chocolate in the kitchen, and Jill's young cousin, Helen Barr served them on a borrowed tray. Helen was sixteen, with a great deal more length of leg and arm than was graceful, and coltish ways. She came very near upsetting a cup of hot chocolate on the mourning dove, as she called Mrs. Orr.

"Oh, Helen, don't call her that," Jill chided. "What a strange idea!"

"You wouldn't think it strange, Jill, if you'd ever seen a mourning dove," Helen explained. "I saw lots of 'em that winter I was with papa in Florida. She looks just like 'em—little and gray and quiet; oh, so awfully quiet! And forever coo-cooing. She's been cooing to Joel for the last half hour, and that old Miss Jessup hasn't taken her eyes off 'em. I read the other day that one widow was equal to twenty-five old maids, so you better look out."

"Oh, Helen!" Jill breathed, flushed and exasperated. "As if I cared!"

Helen scrutinied her judiciously. "You'd care like anything if the mourning dove cut you out," she said. "It's one thing to keep a man dangling and another to see him drop suddenly into some other woman's arms. If ever any man acts as though he wanted me, I'll put him out of his misery one way or the other inside of no time."

"By that time, my dear, I hope that you won't know nearly so much as you do now," Jill retored with dignity.

After that party Dolly Orr was taken into full membership as one of the Pink street family. She soon had her hands full of engagements, and everywhere she went was Joel Washburn, who had begun to go about a great deal more than he usually did.

"Have you noticed it, dear?" remarked Mrs. Brink. "He was even at Mrs. Foley's birthday party. Society is growing quite animated since Mrs. Orr's advent. She's really stirring us up. Even you get out more that you used to. I'm so glad of that, Jill. I think it will do you good. It's so nice that you used to know Mrs. Orr. It makes it very pleasant for her and you, too, I dare say."

"Very pleasant indeed," Jill murmured.

In her heart Jill knew very well why she was going out so much more than she had ever done before. Ordinarily she had not cared much for the little social upstirrings of the small, old-fashioned country village. There were other things she liked so much better—books and her piano and her gentle, broken mother. She had been bred nicely, for at first there had been quite a comfortable lot of money. Then her father died suddenly and she was called home from the seminary. Mrs. Wing had never recovered and Jill gave herself up to companioning and comforting her. They were poor—how poor nobody ever guessed, because Jill had the knack of keeping all the seams underside. Sometimes she feared that Joel understood, and that added to her pride. It was coming to her slowly and painfully that Dolly Orr was thrusting herself deliberately and successfully between her and Joel. And it was in order to see the two that Jill went everywhere.

Jill could not get away from Dolly, who hung upon her life like a lichen to a limb. Apparently Dolly could not breathe without Jill's approval. She must be at Jill's every day, or have Jill with her. Jill must lend advice concerning her frocks—and she had so many of them!

"It's so nice she's taken you for her chum," said captivated Mrs. Wing.

What could Jill say? She read Dolly aright. In those long ago days of her girlhood she had not liked her, and she liked her less now. Moreover, she knew something about Dolly that no one else knew—something that Dolly had betrayed to her in a too-confidential moment. A word from her and she could have destroyed the mourning dove's popularity forever. But she kept her mouth shut and looked on sadly at Dolly's efforts to inveigle Joel.

The end came through Joel himself. He cornered Jill one evening and asked her again to marry him.

"If I don't," Jill returned, "I suppose you'll take Dolly "

"Great scott!" cried Joel. "The mourning dove? What do you take me for? She runs a man too close. Even if I didn't love you and want you more than anything in the world, I'd never look at her. Come, take pity on me, Jill, and help me to escape her by putting on my ring. I've carried it for you six years."

Jill put on the ring. She was convinced at last that she loved Joel. After all, the mourning dove had done that for her.

It was just after Jill's announcement of her engagement that Mrs. Orr closed up her house and stole away. A little later her goods were packed and sent to her, and the house was offered for sale.

It was Miss Jessup who fired the fuse of a high explosive. "The mourning dove's gone back to live with her husband," she said. "It seems they were divorced just before she came here. They've been remarried recently, and all's merry as a marriage bell."

There was a chorus of exclamations for it was teacup time at the woman's club.

Jill flushed brightly. "Oh, Miss Jessup," she murmured.

"I suppose it hurts your feelings to hear this, Jill," Miss Jessup said, "but I can't help it if it does. She doesn't

TEETHING BABIES

Thousands of Them Die Every Summer.

When the baby starts to cut its teeth, then is the time the poor mother is under the stress of great anxiety. For some reason or other the bowels become loose, and diarrhoea, dysentery, colic, cramps and many other bowel complaints manifest themselves, the gums become swollen, cankers form in the mouth, and in many cases the child wastes to a shadow.

When the child gets into this condition the bowels must be very closely looked after, and for this purpose we know of nothing to equal Dr. Fowler's Extract of Wild Strawberry.

This sterling remedy has been used for teething babies for the past 75 years, by thousands of Canadian mothers who swear by its efficacy, and there is no mother but should keep a bottle of it on hand.

Mrs. Gordon McCurdy, Falum, Alta. writes:—"I have five children and they have all had summer complaint, especially while teething. I always keep a bottle of Dr. Fowler's Extract of Wild Strawberry in my home as one or two doses completely relieves them. I cannot speak too highly of it for both children and adults."

Mothers, don't experiment with some new and untried remedy which may be dangerous to your baby's health. Get "Dr. Fowler's" the remedy that has stood the test of time.

Price 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

fool you a mite worse than she fooled the rest of us."

Jill's eyes fisted. She was so happy herself that she could afford to be sorry for the mourning dove.

The Great Health Restorer

You will get rid of the cough and get back your health and vigor just as quickly as did Mrs. J. A. Stonehouse, of Williamsdale East, N.S. who wrote:

"I took a bottle of OLIVEINE EMULSION last spring when I was in a weak condition and had a nasty cough. My cough left me and I also regained my health and strength."

This favorite home remedy is pleasant to take, agrees with the weakest stomach and is suited to every member of the family, young and old.

THE WIDE-SPREAD VALUE OF SALT

Common salt or Chloride of Sodium is obtained from the Mineral Kingdom. It is found native in the earth and is also produced by evaporation and crystalization from sea water, and other water impregnated with saline particles.

The salt of commerce is obtained from three sources, viz., from sea water, from beds of solid rock salt and from salt springs. The neutral compound being formed by the chemical union of an acid and a base.

Salt is a necessary and indispensable substance used for seasoning food, preserving all kinds of meat and fish. It, no doubt, has been known and employed by the first individuals of our race.

The different names under which salt is known are, Common Salt, Culinary Salt and Chloride of sodium. Besides being an essential article of our food, it is something every animal should have regularly. Horses, cattle, sheep and pigs should have it in front of them all the time, and it should be remembered that stock cannot thrive nearly so well without it. Rock salt is the best form in which to have it, as the animals can lick it whenever they want it. Salt has also been found useful in domesticating wild animals. It is employed by the people of all nations from the most refined to the most barbareous. To us it is an invariable constituent of the healthy food.

Salt is used largely for medical purposes, it being so convenient and efficacious as a remedial agent that not only thousands use it with great success, but medical men count it as among their standards.

As you all know, sea-water is better than fresh water for bathing purposes, so if you dissolve one pound of salt in four gallons of water, it forms a solution of about the same strength as sea-water.

In some diseases the moderate use of salt produces the effect of a tonic, it acts as a stimulant to the mucrous membranes, the absorbent vessels and the glands.

Salt, in moderate quantities, promotes the appetite, assists digestion and assimilation. It can be used externally by throwing a handful of salt in a pail of luke warm water, which makes a very effectual wash for bathing, swellings and wounds.

A saturated solution of salt "applied with friction" externally, is used as a counter-irritant in enlargements of the glands and in chronic diseases of the joints.

In case of fainting, salt is sometimes used as a stimulant by rubbing it on the chest.

In case of hemmorhage or sudden occurrence of bleeding or vomiting of blood, salt is usefully resorted to to stop the flow, by taking a teaspoonful of the dry salt.

In case of malaria, where quinine canot be administered, salt has been found to be very efficient, by giving it in half ounce doses, (dry).

A small pinch of salt, (about 3 grains), added to an ounce of clear, filtered, boiled water, makes a very soothing and beneficial eye lotion by applying it with a medicine dropper several times daily.

Salt is used very successfully in case of felons. Take some salt and put it on the hot stove till dry as possible, then take one teaspoonful of pulverized castile soap, a teaspoonful of Venice turpentine, mix well together into a poultice and apply to the felon, renew this twice daily, and in four or five days the felon will open and get well.

Another purpose for which salt is used is for the toothache. Pulverise and mix alum and salt in equal quantities, wet a small piece of cotton and cause the fixture to adhere to it, and place in the hollow tooth. A sensation of coldness will be produced at first, which will gradually subside and with it the toothache.

Salt is again used in cases of sprains and bruises, by filling a bottle half full with salt, add good brandy until nearly full, shake well and allow to settle, then bathe the part frequently with a soft sponge or cloth.

In case of hives, salt baths are of great value, by relieving the terrible itching—two ounces of salt to thirty gallons of water.

In case of heartburn, take a few grains of salt and allow to dissolve in the mouth and repeat this frequently.

Salt is used for sore throat by gargling the throat with a weak solution of halt and water. It is also used for catarrh. A weak solution, one-half to one teaspoonful of salt in a tumberful of water, and sniffed up the nose morning and night, oftentimes leads to a speedy cure in mild cases.

Salt has also been found very useful in case of fits, apoplexy or convulsions, by placing dry salt on the tongue. It is also useful in extreme cases of sunstroke when the patient is in an unconscious condition. Inject a sterilized salt solution into a vein under the skin of the forearm. This has been found most beneficial and has been the means of saving many patients' lives. (One teaspoonful to a quart of water.)

I need not mention Epsom and Rochelle salt, as they are well known to you all.

In conclusion let me say that salt

Constant Headaches

EVERY headache has a meaning—and you should heed this warning of nature, if you would avoid more serious complaints. A headache frequently points to the failure of the kidneys to perform their natural functions.

Gin Pills remove both headaches and cause, by restoring the kidney action to normal. If you let the cause go unchecked, you may incur years of suffering, with frequent attacks of backache, bladder trouble, lumbago, swollen joints, and other evidences of deranged kidneys.

Give Gin Pills a trial. At all druggists—50c a box. Write for a free sample to National Drug & Chemical Co. of Canada, Limited, Toronto, Ont. U. S. residents should address Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

is sometimes used as a fire extinguisher.—Written by Miss Edna I. Oldfield, Secertary of the Newtown and Smith's Creek Women's Institute.

SCOTCH POTATO SCONES

1½ cups flour, 1-3 cup butter, 1 cup mashed potatoes, 2 teaspoons baking powder, ½ teaspoon salt, 1 egg.

Sift flour, salt and baking powder together, add mashed potato, and rub in lightly the butter. Make a soft dough by adding the egg, well-beaten, and a little milk, if necessary. Make the dough of the right consistency to roll out. Divide into three parts, and roll out into rounds half an inch thick. Cut each round into flour, and cook on a griddle. Split and butter them, and serve hot.

REPORT OF WOMEN'S INSTITUTE CONVENTION OF P. E. ISLAND, SEPTEMBER 1st-2nd, 1920.

The Seventh Annual Convention of the Women's Institutes of Prince Edward Island, was held in Charlottetown, September 1st and 2nd, with fifty delegates enrolled. Considering the very unfavourable weather, this was a splendid attendance.

The address of welcome was given by Hon. Walter M. Lea, Commissioner of Agriculture, who expressed his pleasure at the privilege accorded him of welcoming so many delegates. Mr. Lea referred especially to the good work which the Institutes are carrying on in connection with school and community improvement, and urged the women to use their influence to increase the attendance in the rural schools. He laid stress on the fact that the Government does not legislate in advance of the wishes of the people, and said that if the rural communities desire educational advancement, they must agitate for it.

Mrs. Walter Simpson of Bayview replied to the address of welcome, and after thanking Mr. Lea for his words of appreciation of the Women's Institutes, she spoke of the excellent programme which had been prepared for the enjoyment and profit of the delegates. She went on to state that to those who had attended the Convention in previous years, it was an event which is looked forward to and planned for, as one of the greatest pleasures of the year. It is a time when the home cares and work can be dropped for a day or two, and our women realize that after all, through the agency of the Women's Intituteh, woman is coming into her own.

In our Women's Institutes there must be a living germ—the germ of service, of mutual helpfulness. It is so easy in this busy world to attend to our own work and let our neighbour do the same, but how much we miss of the real joy of living and how much more it means to us through life, to once in a while drop our work and take some message of love and sympathy to one who is really in need of it. In closing, Mrs. Simpson said, "Let us all resolve at this Convention to do better—to remedy our mistakes and to put before the world a work of which none need be ashamed." "Service" was the keynote of her address.

Mrs. C. L. Barnes of Georgetown was appointed Secretary of the Convention, then Miss Saunders, Supervisor of Women's Institutes for P. E. I., presented her annual report.

There are now thirty-one active Institutes in the province, with a membership of six hundred. Nearly $5000 was raised by the clubs during the year, most of which was expended on school and community improvements. Fifty visits were made to the Institutes and Assetaoin etaoin etaoinnn when demonstrations in Millinery, Home Nursing and Cooking were given as well as talks on Institute work and other subjects of interest. Teaching cooking to the pupils of the Charlottetown schools is also a part of the work of the Women's Institute Branch. Eight classes a week receive instruction.

During the winter months a series of Short Courses were conducted for the women of the rural districts of the Province. Each class lasted two weeks and practical work in Cooking, Laundry, Home Nursing, First Aid, Sewing and Millinery was given, as well as lectures on many subjects of interest to the home-maker. A six weeks' course for the wives and sisters of the P. E. I. soldier settlers was also put on by the Women's Institute Branch.

Miss Saunders spoke of the great opportunities for service afforded the Women's Institutes, and urged the members to make the current year the very best one in the history of their clubs. She pointed out that the great success of an Institute is not measured in dollars and cents, but by the spirit of sympathy and co-operation which it has engendered throughout the community.

Following the report of the Supervisor, the branch reports were read, and these proved most interesting. School improvement is engaging the

(2)

attention of most of the Institutes, and many much-needed reforms have been brought about by their agency. Covered drinking fountains, individual drinking cups, hardwood floors, new blackboards, libraries, musical instruments for use in the schools, school gardens, pumps in the school yards, and more sanitary conditions of schoolhouse and out-buildings, are some of the improvements noted in the schools as the result of the work of the Women's Institutes.

The Wednesday evening meeting, presided over by W. J. Reid, B.S.A., opened with community singing, and all joined most heartily in a song service of "Old Time Favourites."

A feature of the evening's programme was a talk by Dr. Helen MacMurchy on Child Welfare Work. Dr. MacMurchy received hearty applause in coming forward, and opened her address by paying an enthusiastic tribute to the Island Province, to its resources and its beauty. "It is twenty years since I first visited P. E. I." she said, "and I have come back to it as often as I could. The Island is noted throughout Canada for its potatoes, its horses, its foxes, but there is something greater than all these, which the Province is producing—Men."

Dr. MacMurchy explained the duties of the Department of Health at Ottawa, and stated that before the formation of this new Department, eight different ministries were occupied with its work, a large part of which fell to the lot of the burdened Department of Education. Now conditions are changed, and a competent staff of educationalists has been appointed to look after the problem of Child Welfare throughout the Dominion.

The great importance of looking after the children, and of raising large and healthy families, was emphasized. We should not only see that our children are reared strong and healthy, but that their school life should be made comfortable and inviting. Some of the schools, even in this great modern Canada, are maintained in a disgusting condition, through carelessness or ignorance, and the Dr. appealed to the women to do all in their power to remedy such conditions. In closing, she emphasized the importance of accurate registration of all marriages, births and deaths.

Following the address of Dr. MacMurchy, a vocal solo was rendered by Mrs. Wm. Trainer, and was much enjoyed.

Dr. Ira Yeo, Chief Provincial Health Officer, then addressed the meeting. Dr. Yeo spoke on the subject of Medical Inspection of School Children. He emphasized its paramount importance, not only to the children themselves, but to the country. This is an age in which efficiency is being demanded in every department. In the industrial world old ideas and methods have been discarded, and it is time that they were being "scrapped" in our educational system. The necessity for medical inspection of the school children is urgent. It has been neglected in the past because its great necessity has never been brought before the public. "To the members of the Women's Institute of this Province," continued Dr. Yeo, "the appeal is made to establish this great movement."

At the close of the meeting a hearty vote of thanks was extended to the speakers.

The Thursday morning meeting of the Convention opened at 9.30 a. m., with Miss Helen McKenna presiding.

A talk on "Girls' Clubs" was given by Miss Bona Mills, Sec'y. Y. W. C. A., and an interesting discussion followed The idea of Junior Women's Institutes for the girls was received with much favor, and it is thought that a number of these clubs will be organized in the near future.

Miss Helen J. Macdougall, Supt. Women's Institutes for Nova Scotia, was the next speaker. She gave a splendid talk on "Institute Work" which was thoroughly enjoyed by all, and those who listened to her could not but be impressed by the boundless opportunities for service confronting the Women's Institutes.

Miss Macdougall also explained the aims of the Federal Women's Institutes of Canada, and read the Constitution. The question as to whether P. E. I. would join the Federation, was then discussed. W. J. Reid, B.S.A., representing the Commissioner of Agriculture, stated that the Department would pay the initiation fee and, for this year, bear the expenses of two representatives to the Board of Directors' meeting in Montreal. (Applause). It was then moved, seconded and carried that P. E. I. join the Federation.

Thursday afternoon meeting opened with Miss Saunders presiding. The naminating committee's report was read by Mrs. C. L. Barnes, when the following was presented as candidates to represent the Province on the Board of Directors—Mrs. John McGuigan, Mrs. Gordon Ives, Mrs. Wm. Cotton. Vote by ballot being taken, resulted in the election of Mrs. John McGuigan Hope River.

Throw away your Wash Board—let this Vacuum Washer do the Work

You need never dread wash day or suffer with tired limbs and aching back again. With this scientific Compress and Vacuum Clothes Washer all scrubbing and rubbing and hard work is eliminated, and washing clothes becomes a pleasure instead of a task.

This Vacuum Washer is Woman's Greatest Friend

Many women have discarded expensive washing machines for it. It is the best, strongest and most complete washer. It will wash anything from the finest laces to the heaviest blankets without injury. Every washer is guaranteed to give satisfaction or money is refunded.—Worth $5.00 (this advertisement worth $2.00 if you send it with order at once.)

Send $3.06 (6 cts. is Govt. Tax) by Postal Note or Money Order or if Cheque, add 15c for exchange and we will send a washer post paid, complete with long handle and exaust protectors. Order to day. This offer is good for a short time only. AGENTS WANTED.

GRANT & McMILLAN CO., 387 Clinton St. DEPT. 1 M F TORONTO

HOUSEWORK AS A BEAUTIFIER

It has long been said that housework and beauty cannot go hand in hand, but it remains for the woman of 1920 to prove that she can do all her own housework and be as dainty and pretty as her next door neighbor who keeps a hired girl. It is quite unnecessary to have red, rough, unsightly hands because you wash the dishes three times a day or do the family washing, and so it goes with all the other household duties; they can be done so you are not less but more beautiful.

The girl who knows how to do her housework in a sensible manner will be able to broaden her chest, improve her complexion, keep down the pounds of flesh that cause her to ache with fatigue, beautify her hands and arms and receive the chance visitor with a radiant smile.

I hope the busy housewife won't smile incredulously at this and read no further, because I may be able to give her a few practical hints on the beauty possibilities of the ordinary humdrum home duties.

In the beginning, make up your mind that you like housework, that you love to do this for your mother or father, or perhaps your husband, remembering how many things they have done for you. If you get into this frame of mind you will give an extra shine to the kettle and an extra pat and smooth to the bedspreads. It's all in looking at things as they are, and when you come to think of it, making a home is a pretty big thing to do and there is every reason you should be proud of it. Don't forget that.

"But," you say, "what about red hands with blisters where you hit them on the hot pan, or tired backs from ironing and washing?" Yes, I know, and that is what I am coming to.

Suppose we take up dish-washing first, because that is something that comes three times a day and can't be avoided. There is a right way and a wrong way of washing dishes. You mustn't bend way over until your back looks like the half of a barrel hoop. If you do this, it explains why you have such an aching back all day long. Try standing erect when washing your dishes, and be sure not to stand with all the weight on one foot. That gives you a foot ache. Stand levelly on both feet.

To avoid putting your hands in the dish-water, use mops for washing the dishes. These can be made by taking a short stick and tying a mop of soft cloth at one end. With this you can wash everything but the pots and kettles.

I suppose, of course, as soon as you are through cooking you fill these utensils with water, so they will not be hard to clean. If you do this, you can easily clean them with a long-handled stiff cleaning brush, and just as quickly as if you were soaking your hands in the greasy, soapy water.

One of the most convenient things I knew of is rubber gloves for dish washing, window cleaning, scrubbing, etc. They are not expensive and will last for a very long time if you are careful not to cut them. Think what a difference it would make in your hands! They would be soft and white and you could go out to entertainments without being ashamed of them.

With your hands so carefully protected, you wouldn't mind splashing around in the water and giving every dish a little extra attention. For my part I love to wash and dry dishes, but, of course, I see that my hands are taken care of.

It is easy to burn one's hands on the hot stoves or dishes, but I've found that a substantial dish-cloth hanging handy to the stove, and careful covering up of the hands when taking dishes out of the oven, or stirring things over a hot fire, will keep your hands free from the ugly, disfiguring burns and blisters. The only times I have been burned was when I was careless and not paying attention to my work.

Remember when scrubbing the floor to use the rubber gloves. You can clean the floor just as well so and keep your hands white and soft.

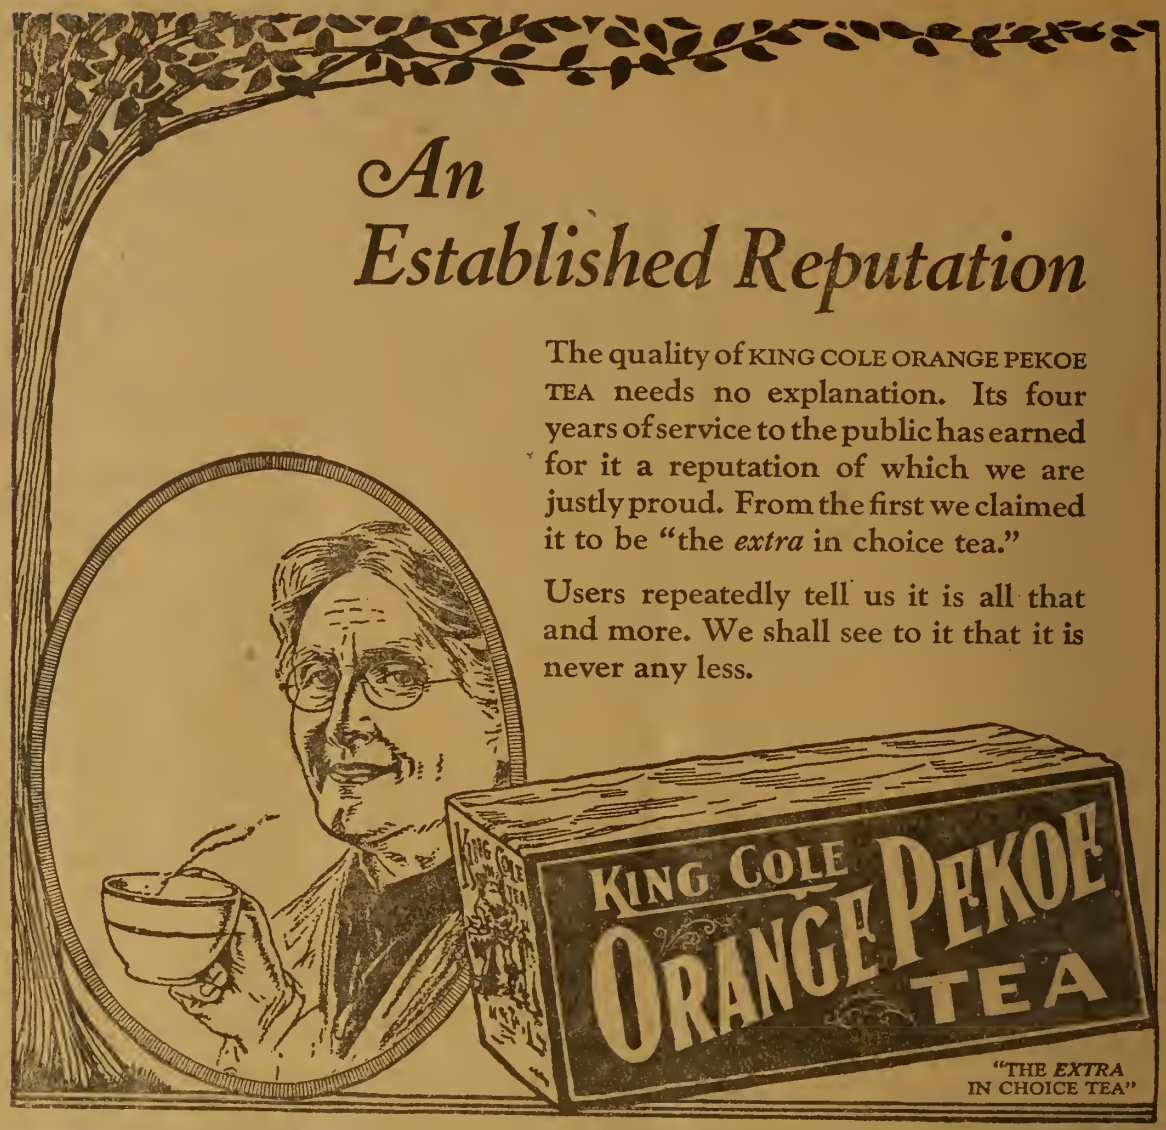
Nowadays the long-handled, self-wringing mops are much used, and they keep the floors clean, if plenty of floor soap is used, and think what a saving to your back and knees!

When you are paring vegetables or fruit, and find you have stained your hands, you can remove these marks by rubbing on a little oxalic acid. Your druggist will tell you how to use it. A slice of lemon will do the same work and is much cheaper. So you see you need not have stained hands, unless you want them.

Perhaps you have thin arms. Let me tell you a secret. Window-washing will develop them better than anything I know of, making them round and shapely, so that the new, tight-fitting sleeve can be worn without fear. Think of that!

Washing clothes is not considered a very desirable occupation, but if you use plenty of water, soap and a wringer, and remember to place the tubs high, so you won't need to bend over much, you will find it doing you more good than harm, as in this way your skin gets its weekly steaming. When the clothes are all hung out on the lines to dry, run into the house, wash off the perspiration with soap and water, massage in a little cream, fluff on some powder and see if your skin doesn't feel and look the better for its steaming over the tub. Ah your hands are all puckered up from being in the water so long, rub them while wet, with cider vinegar and they will become smooth quickly. As soon as this is done rub in a little sour cream, slip on a pair of gloves made of drilling and hie you away to sprinkle the clothes and begin your ironing.

This is not hard, and if you have



An
Established Reputation
The quality of KING COLE ORANGE PEKOE TEA needs no explanation. Its four years of service to the public has earned for it a reputation of which we are justly proud. From the first we claimed it to be "the extra in choice tea."
Users repeatedly tell us it is all that and more. We shall see to it that it is never any less.

SUGAR--15c.

St. Kitts Brown Sugar

200-lb. Sacks Delivered to Your Station

WE HAVE a limited quantity of the genuine Brown West Indian Cane Sugar, which we will dispose of in the original sacks of 200 lbs. each at 15 cents per pound, all charge paid to your station.

This is a rare opportunity for housekeepers, bakers, lumber operators, etc. It is the real old-fashioned St. Kitts Sugar—better than refined for baking, brown bread, mincemeat, baked beans, dark preserves and pickles.

Samples will be sent to all interested.

WRITE FOR SAMPLE AT ONCE, OR WIRE YOUR ORDER.

Cane Mola Co. of Canada, Limited

1706 Notre Dame Street East, Montreal. Telephone Lasalle 2361

the windows open so you can breathe fresh air, your board placed high so you need not bend your back, it is really nothing but a pleasure. I know because I've doue it.

Every girl or woman wants to have a pretty bust and broad chest, and instead of telling her to take this or that, I am going to ask her to—sweep.

Sweep with back held erect, broom held firmly in both hands, and a smile on your lips. Why, you cau do as much for bust and chest by sweeping as your heart could desire, but not unless you stand up. Sweeping with bent back and bowed-in chest will spoil your figure aud ruin your health. Health is beauty, girls dear.

The hair, to be pretty and easily dressed, must be kept from the dust and so I think it a good idea to make a dust-cap of heavy cottou cloth, (muslin isn't thick enough, Miss Vanity), and put it on after breakfast is over, the dishes washed and dried and you ready for dusting, sweeping and making beds. You will find your hair comes out just as soft and pretty, after a regular orgy of dust, as if you had been gathering flowers in the garden.

When dustiug the high mouldings and big pictures, never use a long-handled brush, but have a small firm step-ladder. Climbing the steps is mighty good exercise for the thick waist, and the girl who wishes to have the long waist so popular now, should try dusting the high places standing on a step-ladder.

If the busy housewife intends to take a morning for polishing the silver or polishing the range, she should first rub on her hands a generous supply of mutton tallow, also filling up the spaces under and around the finger nails. In this way the grease prevents the grim from filling the pores of the skin and a little soap and water will cause the hands and nails to come out perfectly nice, instead of one having to rub the skin off with a nail brush.

As most working clothes are not beautiful, why not make your working dresses out of some pretty light brown or blue or of black and white calico? Get cheap washable stuff and make the dresses with plaited skirt, walking length, the waist buttoning up the back with short sleeves, simple blouse and low turn-over collar or no collar at all, just a low Dutch neck? Make the dress all in one piece with sewn-on belt. When working, cover with big apron and if anybody comes in unexpectedly throw off the apron and there you are as neat and pretty as you can be. This dress is suitable for afternoon and evening also.

USE MORE MILK.

There is no article in the human dietary so little understood as milk.

Milk is a real food, just as much, and even more so, than meat. Milk contains all the food nigredients of meat and, in addition, contains a vital food substance indispensable to growth and health. Milk is a perfect food, and a complete food. It is also a productive food, in that it tends to make good the deficiencies of other articles of the diet. Its protein, or muscle-building ingredients, are ideal in quality, its sugar is of the best, its fat is superior to the fat of any other food because of the presence, in large quantities, of this vital substances called fat soluble A, so essential to human welfare, and its mineral matter is most wonderful in promoting growth and repair and stimulating the physiological functions of the body.

The United States government says:

Milk is the best food we have. Give your children milk, a quart a day for every child if possible, a pint without fail. Plenty of milk will help you give all your children, both big and little, the chance for health they ought to have. Buy more milk and less meat and your family will be better fed.

Milk is an economical food, too, one quart being equal in food value to eight eggs, or four-fifths of a pound of beefsteak.

For milk to be as expensive as beefsteak, it would have to sell at 30c a quart, while if it cost proportionately to eggs, to would sell for 40c a quart, when eggs are 60c a dozen. If milk were sold, in proportion to the selling price of tomatoes, it would sell for exactly $1.00 a quart when canned tomatoes tell at 15c per pound.

These comparisons do not take into consideration the additional vital substances to which we have previously referred, which promote growth and health, neither do these comparisons take into consideration the valuable and superior mineral matter found in milk.

"The All-Purpose Sugar"

2 and 5-lb cartons
10, 20 and 100-lb. Bags

PRESERVING LABELS *FREE.* Send us a red ball trade-mark, cut from a bag or carton, and we will send you a book of ready-gummed labels containing six labels for each of the following fruits: Strawberries, Raspberries, Blackberries, Currants, Grapes, Cherries, Plums, Peaches and Pears. Also ask for the LANTIC LIBRARY, the most complete collection of recipes for sweets ever published. Three separate books on Preserves, Cakes, Candies and Desserts.

Peaches

The most valuable of all fruits for preserving. Home preserved peaches give at small cost, autumn's most luscious fruit for our winter enjoyment.

Lantic Sugar

is best for peaches and all other preserving. The clear sparkling syrup develops all the exquisite flavor of the fruit. Pure cane, "FINE" granulation. Experienced housekeepers order it by name all through the preserving season.

True Tests of Merit

The Feed Lot and The Market

On June 15th the Sni-a-bar Farm marketed at Kansas City two loads of two-year-old steers out of grade Shorthorn cows and by a pure bred Shorthorn bull.

The steers averaged 1412 lbs. and sold at $17 per cwt., the highest price paid on that market for cattle of any age or weight since December, 1919.

The next highest price for a load of two-year-olds was $16.50 per cwt., paid for a lot from the Kansas Agricultural College. These steers were *not Shorthorns*, and they averaged 960 lbs. per head.

These two lots of steers were the same age and were fed by equally skilful feeders, but the Shorthorn steers outweighed the others by 451 lbs. per head, and outsold them by $81.48 per head.

Those who tell us that steers of other breeds outsell Shorthorns will find difficulty in reconciling their statements with the facts given above, as well as with many other similar authentic instances which can be furnished.

In these three booklets, Breeders will find interesting facts regarding the Shorthorn Breed. They will be sent free on request.

Only One Conclusion

If you want quick-growing, early-maturing, easy-feeding, "market-topping" steers, use a good Shorthorn bull.

CARE OF TURKEYS.

(Continued from page 908)

that is extremely plump and white. A little suet mixed toward the end of the season will materially aid, also. Another good fattening ration is ground oats moistened with skim-milk and a little mutton fat added every other day. Still another is equal parts of cornmeal and ground barley with boiled potatoes or boiled rutabagas.

All mashes should be mixed soft but not sticky and when fed, grit and charcoal should be supplied.

PREVENTION OF OAT SMUT.

The Wet Method, Formalin Treatment

A day or two before the oats are required for seeding they should be piled in a heap on a clean barn floor, and the pint of formalin poured into a barrel containing 40 gallons of water. With a broom or sprinkling can the solution should be sprinkled on the grain. At the same time the grain is shovelled over and over until every grain is wet. The pile of wet grain should be left for two or three hours, then covered with clean sacks for five or six hours or over-night. After this the grain should be spread out to dry. In order to avoid recontamination of the treated seed before sowing, it is advisable to dip the bags or sacks in the barrel of formalin solution while the grain is being treated, and allowed to dry. Grain thus treated but not required for seed is perfectly safe to use for feed.

The Dry Method, Formalin Treatment

Place the oats to be treated in a pile on the granary or barn floor and shovel them over into another pile, and as they are being shovelled over spray them with a solution consisting of one part formalin (40 per cent. formaldehyde) and one part water. Use this solution at the rate of one pint to twenty-five bushels of seed, that is, use half a pint of formalin mixed with half a pint of water for every twenty-five bushels of oats. If smallor larger quantities of oats are treated, use proportional amounts of formalin and water. Thus, twelve and a half bushels of oats require only a quarter of a pint of formalin mixed with a quarter of a pint of water. A small quart sealer, costing about $1, is most convenient for spraying the formalin solution on the oats. Two men can best do the work. One man shovel the oats while the other sprays each shovelful. In order to avoid irritation of the eyes, nose and throat, from the strong formaldehyde fumes, provide for a free circulation of air through the granary and barn when the work is in progress. The irritation of the eyes and throat by the strong formalin fumes is the chief objection to this method but it can be overcome by holding the sprayer down close to the grain and providing plenty of ventilation. After the oats are all sprayed they should be piled in a heap and covered with blankets or sacks to confine the formalin vapor. After five hours the seed should be uncovered, bagged, and may be sown immediately. There will be no delay waiting for the seed to dry and no wet and swollen seeds to choke the drill. It is advisable to sow the treated seed as soon after treatment as possible.

Precautions to be Taken

1. Use the formalin solution of the exact strength and in the proportions recommended.

2. Be sure and cover the treated seed as instructed.

3. Take precautions to see that the teared oats are not reinfected with smut spores. Sacks, bins, implements, etc., used in handling smutted grain must also be disinfected. The sacks should be dipped in or sprayed with the formalin solution and the seed drill should be cleaned and a little strong formalin run through it.

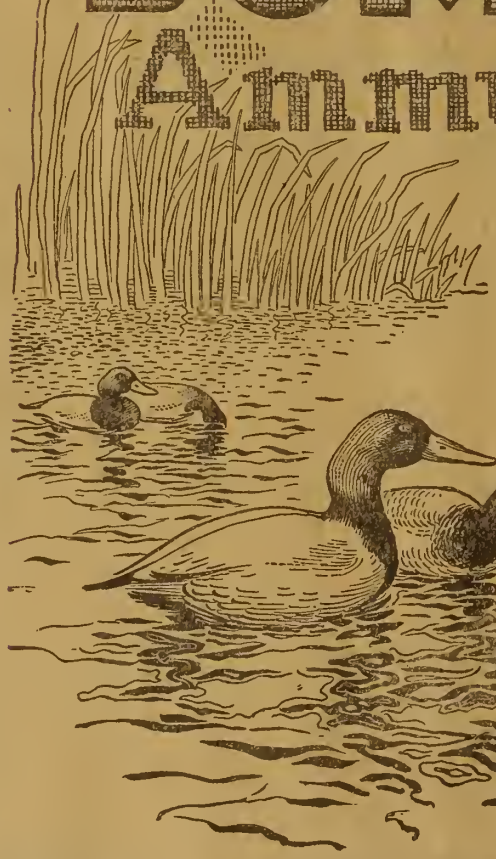
The Game of the Epicure

ITS popularity as a table bird has long given the Canvas-Back Duck foremost recognition among the feathered game of Canada. Although epicures made it famous, the Canvas-Back is in the first ranks of game birds—wary, speedy, when well on the wing—possessing every quality the sportsman admires.

A string of Canvas-Backs driving across the wind, their long bills and heavy necks straight out—the white plumage of the drakes flashing in the sun—is a picture that lives in the memory of the duck shooter.

The Canvas-Back's wariness and flying qualities demand a true aim and a hard-hitting load. Seek good feeding grounds for the best bag and use

DOMINION Ammunition



in Canuck, Sovereign or Regal Shells, preferably with No. 4 or 6 shot. All Dominion Smokeless Shot Shells are individually water-proofed, steel reinforced and loaded with double-chilled shot, Canadian-made shells adapted to Canadian use, and guaranteed by the big "D" trade-mark.

Our new game book, "The Call of Canada," with illustrations of Canadian game birds and animals, reproduced in full colors, contains valuable information that will interest you. Every sportsman should have this beautiful book in his library.

COMMON PRINCIPLES OF PRUNING TREES.

A few common principles of pruning trees are: First, do not cut the back entirely out of the tree. The old idea of pruning was to cut the middle out of the tree, retaining the lower limbs with their laterals as bearing surfaces. This let the sunlight in but it made a tree that developed weakness especially in its ability to withstand storms. These lateral limbs would grow and when they were weighed down with fruit it would not take very much of a wind to break down a limb. In the later day pruning the central part of the tree is retained. Second limbs that cross should be cut away, since it is necessary to get as much sunlight into the tree as possible. Some tree pruners think that the measure of their prunings is the size of the brush pile they leave at the foot of the tree. It may be suggested, however, in passing, that there is a great deal of difference betweeen a tree butcher and a tree pruner. A good rule to follow is not to cut off a limb without a good reason for it. Third, tall trees should be headed back some. It costs some more to pick the apples from an excessively tall tree as compared to one that is low down. Some make the mistake of cutting off lower branches, thinking thereby to make it possible for the horses to work closer to the tree. This is a very serious mistake since the soil in the orchard is of little use as a crop producer and it does not take very much barking of limbs or trunks with hames and whiffletrees to spoil a tree. It is much better to keep too far from a tree than too close to it. Fourth, the most important principle of all in pruning is to make the cuts on the limbs as close to the trunk as possible. A long protruding stub is an eyesore to man, and a body sore to the tree. It dries out, water enters the cracks, decay sets in and in a few years a good wind comes along and over goes the tree.

IT'S DIFFERENT NOW.

In the spring, a young man's fancy
Oft my spotlight will reveal.
Is—one arm about the Nancy
And the other on the wheel.

Times agone, of equine sporting—
Times that modern youth disdains—
Youth used two arms for his courting,
Trusting Dobbin with the reins.

—Rex Stackhouse, in Motor Life.

PREPARING GRAINS FOR FALL FAIRS.

(Experimental Farms Note.)

It pays to advertise. There is no better advertisement than to be a prize winner at the fall fairs and no crop on the farm can be exhibited to better advantage than the cereal crop. To attain the best resutls, a special plot should be maintained and kept thoroughly clean, free from weeds and all impurities. Harvesting should be done by hand, keeping the sheaves as neat and straight as possible.

First and foremost the grain in the sheaf must not be weathered, it must be perfectly dry and of good colour. The best results are obtained by the use of slightly immature straw, as it will be found to be less brittle and easier to handle. The straw should be spread in thin layers in the sun to dry; the sun will bleach the straw as well as dry it. Use only straight, uniform straws to make the sheaf; two or three sheaves should be collected in the field to allow for waste.

The majority of persons have the idea that all the straws should be the same elngth and the heads all placed on the same level. This should give us the square head in which, when tied, the majority of the straws would break off below the head. The ideal sheaf has a rounded head with a gradual curve. This rounded head is produced by allowing the central straws to stand a little higher than the surrounding straws and each layer of heads that are alided, to gradually slope away from the centre. The lasge sheaf may be conveniently formed by fisst making a number of small sheaves and then placing them together as though they were individual neads, gradually sloping them off in the same manner. To finish the sheaf a layer of individual heads should be placed around the whole producing a finished exhibition sheaf. All the loose leaves should be plucked off the outside of the sheaf with a jack-knife leaving only the white shining straws, and all heads that do not conform to the symmetry of the head may be cut off, elaving a perfeit sheaf. Coloured ribbon about ½ or ¾ inches wide may be used with good effect to cover the binding strings.

The remainder of the plot should be threshed by hand. This will form the bulk sample for the fair. If the plot was kept pure in the field ther will be very little that will need to be done to the threshed sample. A good fanning mill will remove all shrunken and small kernels, all chaff and dirt. The fanning mill must be clean, many an excellent sample has been ruined by a dirty fanning mill. Thoroughness is the secret of a good sample, the fanning should not be spared even if it means fannig away 50 per cent. of the original sample.

The bulk sample may be double bagegd for shipping to the fair. The sheaf should be shipped in a box, ¾ inch longer and ½ inch broader than he sheaf. The sheaf should be wrapped in paer and tied, fitted into the box and kept in position by supports.

With our present day standards always improving, great care must be taken in preparing the exhibits for our fall fairs. No prize will be won by the farmer who puts up a rough sheaf or a poor sample. The secret of success is thoroughness.

SCALY LEGS.

Would you please let me know through your columns what to do for chickens with scales on their legs?

Ans.—Uuse one of the scaly leg ointments advertised, or if you prefer, carry out the following: Soak the legs well in fairly warm water, and anoint with a mixture of lard or other grease and coal oil, or if preferred use carbolized vaseline, which may be had from any druggist. The latter is best if you desire to retain or to restore the leg color.

The Cost is so small
for the protection you get

THERE are millions of dollars invested in farm buildings and machinery. Both property and implements can be indefinitely conserved by paint and varnish at a cost amounting to only a fraction of the loss which otherwise occurs.

Yet hundreds of thousands of dollars are lost every year to our farmers through rust, rot and wear.

Rust is the deadly enemy of implement or machine. The best steel cannot withstand the inroads of the elements without surface protection.

The same elements that make rust, just as surely spell rot and ruination for your frame house and farm buildings.

And what rust and rot do in one direction, wear will do in others—to floors and furniture for instance.

The surface is the danger spot. All decay, rust and wear start there. Surface protection—paint and varnish—will save your property.

The property owner who tries to save a few paint dollars, loses many dollars in repairs and replacement.

Save the surface and you save all.

THIS ANNOUNCEMENT *is issued by the Canadian Save the Surface Campaign Committee, for the purpose of educating the public in the Preservative and Protective value of Paint, Varnish and Allied Products for the Conservation of Property, and has received the approval of the Canadian Trade Commission in the following words:*

"The realization of the above objects will lead to employment during the Reconstruction Period and bears our entire approval.

THE CANADIAN TRADE COMMISSION

Commissioner.

RHUBARB.

To have really good rhubarb it is necessary to have two plantations, and pull from them in alternate years.

The function of the rhubarb stalk is to collect the organisable matter necessary for the growth and welfare of the plant and, at the autumnal season to decay, pass it on to the root system, which stores it for further and enlarged efforts.

Therefore, if the stalks are taken away, the whole system of the plant suffers, and the produce dwindles both in size and puality.

Hence the necessity of two plantations, so that each, in turn, may have a full season to recuperate.

No pulling should be allowed after July, if you wish to have and keep a thrifty growth.

Rhubarb may be raised from seed, but should not be plucked until the third year, and then only light toll should be taken. Good and deep preparation is necessary, and the ground cannot be made too rich, yet is must be firm.

Cut out all seed stalks as they form, and do not allow them to develop; the seeding process is a most exhausting strain on the energies of the plant.

Cover for winter with dry manure, and in the spring let the new crowns push their own way through.

By following this system of growing you will have lots of good rhubarb, every year, but don't forget which plantation is resting.

HOW HE DOCKS LAMBS

In docking lambs I take the lamb on my knee, with its rump to the fence and its tail over, and with my left hand pull the loose hide up on the rump as I crowd the lamb to the fence, at the same time using a shingling hatchet to make the cut. The drawn hide then falls back and covers well the bone of the tail. I perform the operation in the morning, and let the lamb go on grass. No trouble follows. R. F. Brady, Roger Mills Co., Okla.

SALT FOR THE COW.

The dairy cow requires an ounce of salt a day, and while she should be given all she needs, she should not be forced to take more than she wants. It is best, therefore, to give only a small quantity on the feed, and to place rock salt in boxes in the yard.

The first farmer was the first man, and all historic nobility rests on possession and use of land.—Emerson in "Society and Solitude."

Save Money

by using

Economy

Ready Mixed House Paint

On Your Farm

Paint isn't merely a matter of appearance. It is first of all for protection against atmosphere and weather.

"Save the Surface and You Save All"

If you coat the surface with good paint, the destructive elements cannot get at the wood to rot and wear it. So it saves you money. Economy Ready Mixed House Paint is scientifically compounded of pure materials, well ground and mixed. It gives durable protection and looks rich. Use it for inside and outside painting. The price is moderate.

Sterling Shingle Stain
A waterproof, non-fading roof stain in attractive shades. A real protection.

Longwear Barn Paint
Does for barns, bridges, fences, farm machinery, etc., what "Economy" Paint does for dwellings. For wood and metal alike.

How to Get Them

If your dealer does not yet carry these products, mail us this coupon with your name and address, and we will send FREE our color card and price list.

SAMSON

Close Coupled Seat

One-third More Loading Space

Look at this picture of the SAMSON Truck. Note how the seat is placed forward alongside of the hood—instead of back of the hood. This gives one-third more loading space for SAMSON Truck users than is possible in other trucks of same rated size and capacity

Extension Bases

Demountable Cleat Bands Cannot Sink in Soft Ground

This is one of the newest truck inventions and exclusively on the SAMSON The wheels carry extension bases, and the rear wheels are equipped with demountable cleat bands and grouters This provides sure traction in any weather on any road, or in any field Mud, snow, slush or soft ground hold no terrors for SAMSON Truck users

Built for Farm Work

The Samson Truck is not just an ordinary truck for average hauling on good roads. It is a practical, proven mechanical unit and is built especially for farm hauling in the hard-going fields, as well as on the worst roads. You can use it in soft, slushy fields. You can use it on heavy, muddy roads. The Samson makes its own road. This is important to farmers in this community because it means in bad weather, when the roads are muddy and the fields are soft, the owners of Samson Trucks will not have their trucks idle at busy times. They can go right along with all their hauling. The special and exclusive Samson Truck features, explained opposite, make this possible.

(Continued in next issue)

"More general use of pure bred sires in all classes of domestic animals will greatly increase our resources in valuable grade stock as well as pure breds," says Dr. Mohler, of the U. S. Department of Agriculture, "both qualities of breeding now being and promising to continue in demand.

MILK FROM SHORTHORNS.

English breeders of Milking Shorthorns are paying considerable attention at the moment to improving the milk yielding power of their herds. The points which indicate milk power are readily distinguished, and the most important of these are the organs which co-operate in the formation of the milk. These consist of the vessels which bring the blood, the glands which separate the milk, and the veins which carry away the blood when thus acted on. Of the former we may name the veins observable immediately above the udder, and although these are often buried so that they cannot be seen, yet a gentle pressure immediately above the udder generally brings them into sight. If the skin is mellow, and not much fat present, these veins show themselves readily. While it is desirable that these veins should be prominent, the fact of their being hidden need not necessarily condemn an animal as a bad milker. Tae milk glands are situated in the upper portion of the udder, and are generally four in number, each gland having a connection with its own quarter of the udder. The udder should be capacious, the coat should be thin, with a soft skin, and show considerable decrease in size after the animal is milked. The animal being supplied with suitable feed, which after its digestion enriches the blood brought to the milk glands, the production of milk is then dependent upon the activity of the milk or mammary glands. As a matter of fact, these glands are a common cause of difficulty. The enriching of the blood and its access to the milk glands are in general easily secured, but the activity of the milk glands largely determines whether the materials in the blood shall be separated as milk or sent on for use by some other organism.

With a view to encourage this milking character rather early breeding is desirable, and when the flow of milk has been established much may be done to encourage the yield and favor its increase in quality. A liberal supply of soft juicy feed and water and a careful avoidance of any feed likely to cause an inflammatory condition of the blood will be found to favor the production of milk. Regularity in the removal of the milk and its complete removal are important conditions for encouraging the flow of milk.

The offspring judiciously bred from a cow in which the milking power has been so encouraged would commence life better prepared for its future duty, and, with similar care and attention to its production of milk, it would not only be a better milker, but better able to impart a strong milking character to its descendants. The male animals so bred would also favor the hereditary convenience of this improved milking character. Thus the exercise of careful and judicious management in relation to the breeding of stock intended for the production of milk cannot fail to be productive of a considerable improvement in the yield of milk, and in the duration of the flow itself.

Economical production of dairy products is possible only when an efficient cow is used.

A good cellar in connection with a farm-house is as important as a well-arranged kitchen.

It is very often as much the fault of the milker, if the cow goes dry, as it is the fault of the cow herself. The way she is handled and the feed she is given are important factors.

Domestic comfort is secured in the community in which the cow holds an honored place.

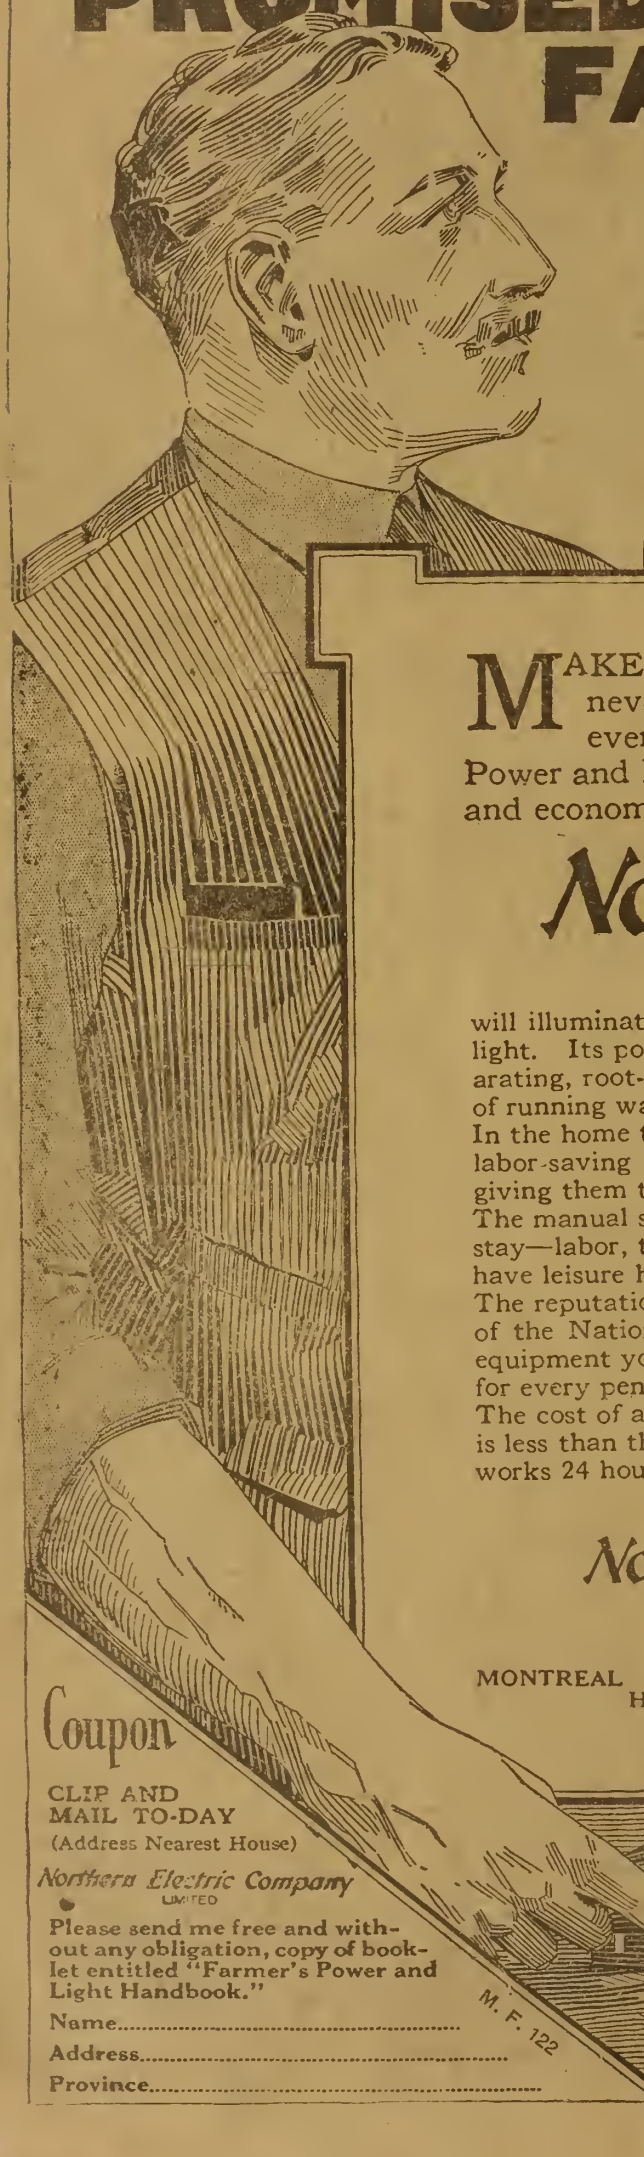
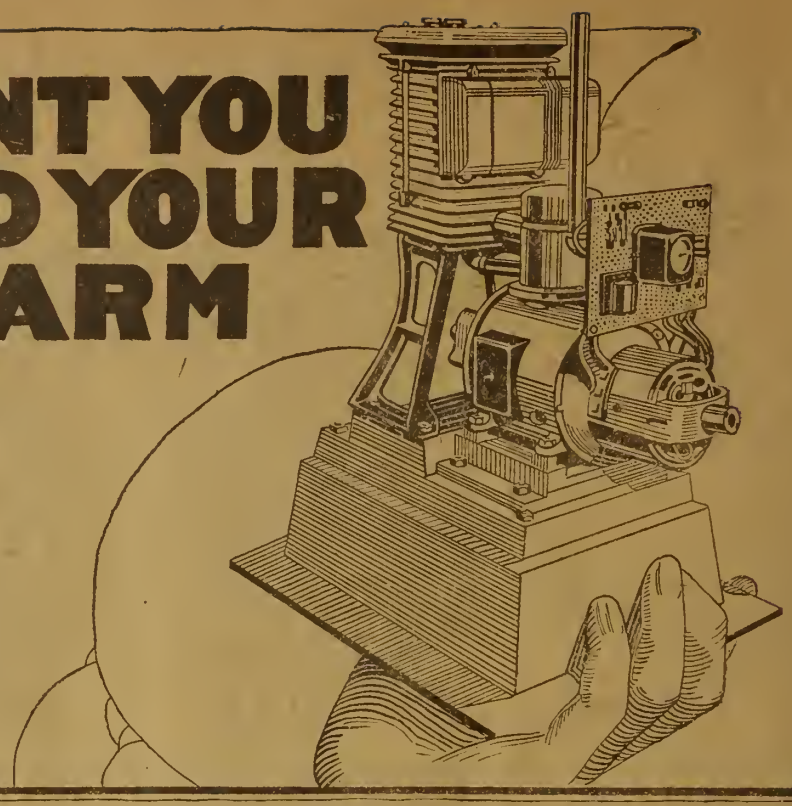
THE PLANT YOU PROMISED YOUR FARM





MAKE good your promise now. Months of waiting will never bring you a better all round farm plant. From every angle you will find that the Northern Electric Power and Light plant will fulfill your requirements completely and economically.

Northern Electric

POWER and LIGHT

will illuminate your house, barns and outhouses with a clean, safe, white light. Its power will greatly lessen the time-taking work of churning, separating, root-cutting, etc., and will enable you to enjoy a plentiful supply of running water for family and live stock use.

In the home the washing machine, electric iron, vacuum cleaner and other labor-saving devices will save the hands of your wife and daughters by giving them the same conveniences as their city friends.

The manual side of your farm work will be lightened. Your hired help will stay—labor, time and money will be saved and you and your family will have leisure hours to enjoy.

The reputation of the Northern Electric Company, Limited, as the "Makers of the Nation's Telephones" is back of any Northern Electric plant or equipment you buy, and it is your guarantee of fair dealing and full value for every penny spent.

The cost of a completely installed Northern Electric Power and Light plant is less than the cost of your hired man for one year's work, and the plant works 24 hours a day.
